

Behavioral Freight Model for the United States

Innovations in Travel
Modeling Conference
June 25, 2018

U.S. Department
of Transportation

**Federal Highway
Administration**

significance
quantitative research

U.S. freight practice will benefit from the new freight model and new data methods.

STRATEGIC GOAL

Advancing National Freight Practice for Decision Making

BEHAVIORAL-
BASED NATIONAL
FREIGHT MODEL

PROJECT OBJECTIVES

FUTURE FREIGHT
AND LOGISTICS
SURVEY METHOD

Develop New Scalable Freight
Modeling Tool and Techniques

Develop New Scalable Freight
Data Collection Method

PROJECT OUTCOMES

- 1 Enhance FHWA In-house Analysis Capability
- 2 Enhance Analysis Practice for Local Transportation Agency

- 1 Address Existing Data Gaps in National Freight Database - Freight Analysis Framework (FAF)
- 2 Enhance Data Collection Methods for Local Transportation Agency

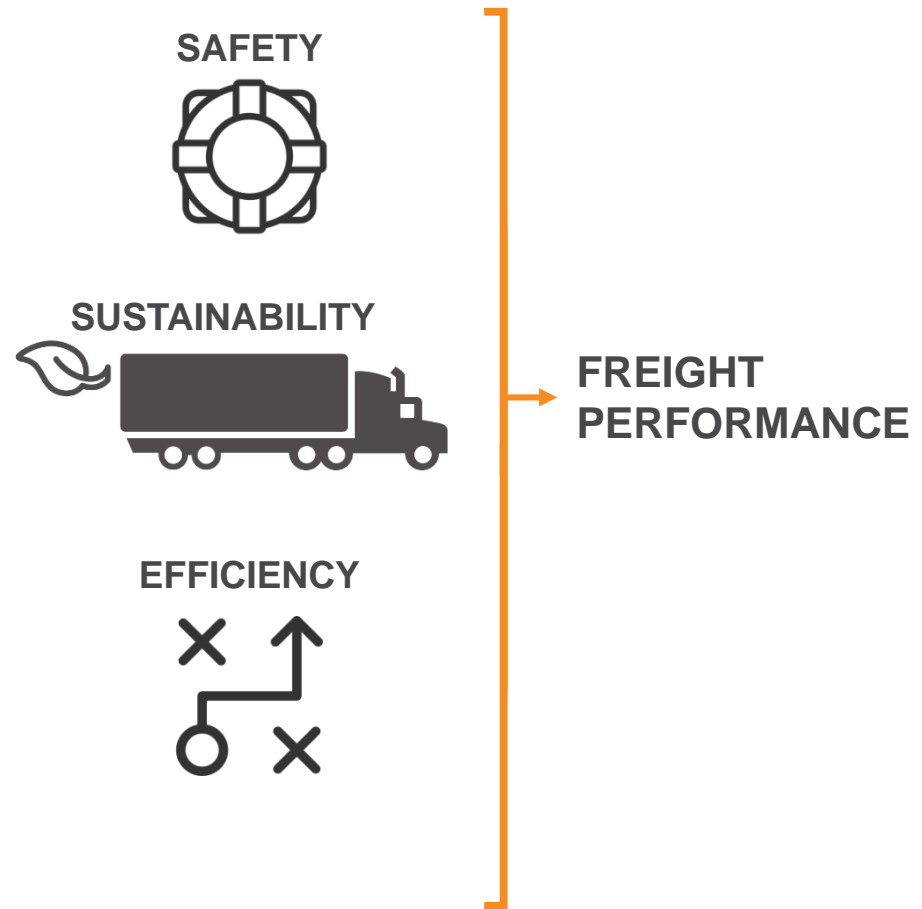

These 4 key elements support the overall goals.

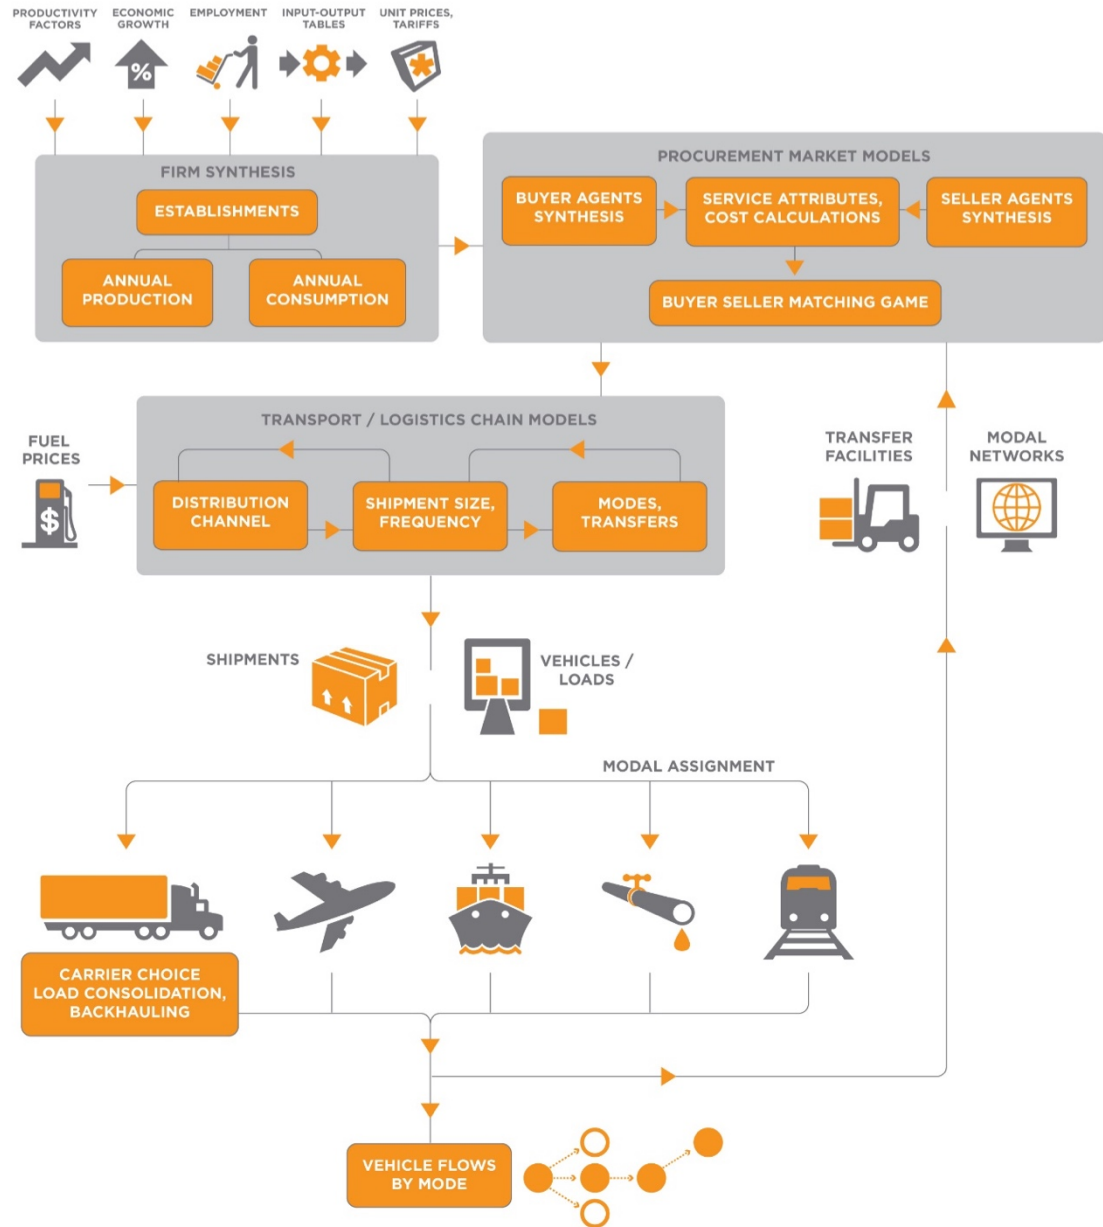

The national freight model enhances our ability to forecast goods movement.

- Evaluate freight investments
- Test effectiveness of national policies
- Support statewide and regional freight planning
- Evaluate private sector and global trade decisions

The national freight model system is multimodal and disaggregate.

There are several key advancements in this research.

- Simulating establishments as a function of the firm to which they belong

- Matching buyers and suppliers in the procurement market using game theory

- Including pipelines as a fifth mode

- Determining carriers for firms shipping goods by truck

- Simulating the backhauling required to reposition trucks for their next shipment

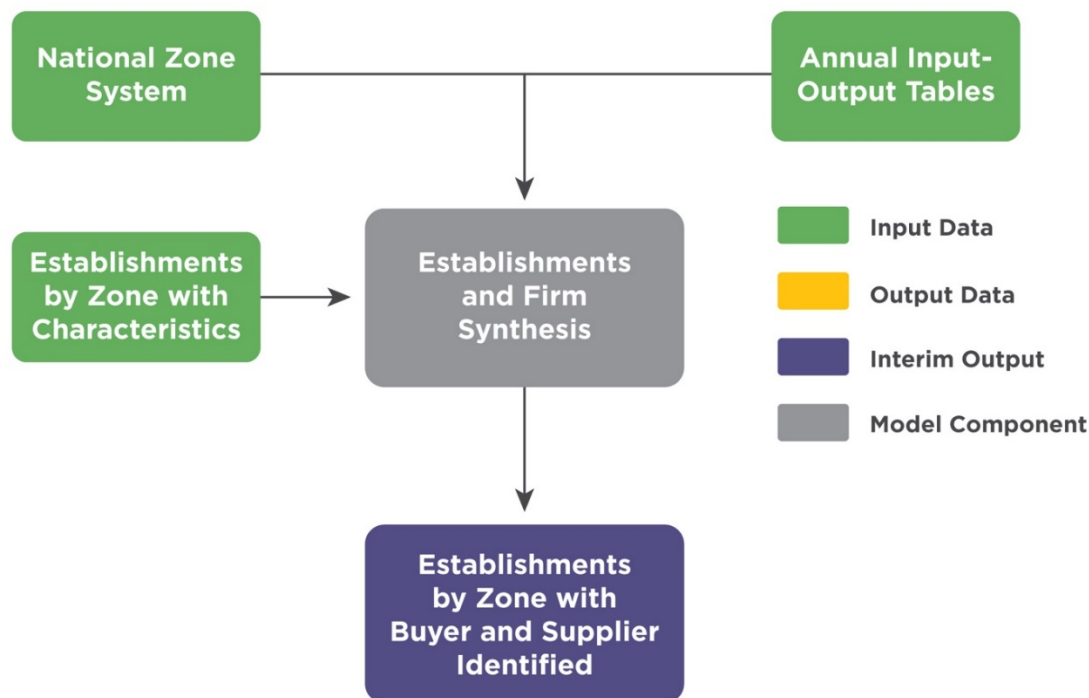

Firm synthesis simulates firms and establishments.

5.9 million firms
7.5 million establishments

- Covers all 6-digit North American Industry Classification System (NAICS) industries
- Allocates establishments to firms based on:
 - industry
 - input/output
 - commodities
 - employment size
 - geography variables

The output for the largest firms show a reasonable distribution.

Establishment Locations (12 Largest Retail Firms)

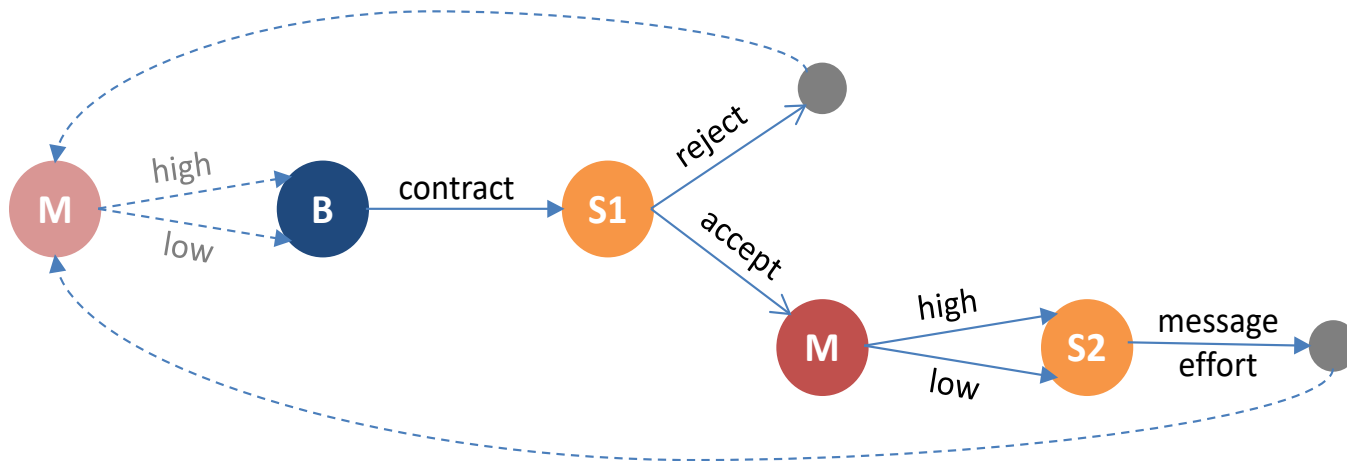

Procurement market is modeled using game theory.

Procurement market game for a single buyer-seller pair.

- The game begins with an initial market (M) assessment by a buyer (B).
- The seller then moves next (S1), deciding whether to accept or reject the offered contract.

Mode choice models will be estimated with Commodity Flow Survey data.

- Discrete choice of a single mode or mode combination, such as rail-truck, air-truck or water-truck, with 54 alternatives
- New explanatory variables
 - Establishment and firm relationship
 - Shipper characteristics
 - Receiver characteristics
 - Geographic specificity
- Pipeline is added as a new mode

Carrier choice identifies which suppliers will use a carrier and then which one.

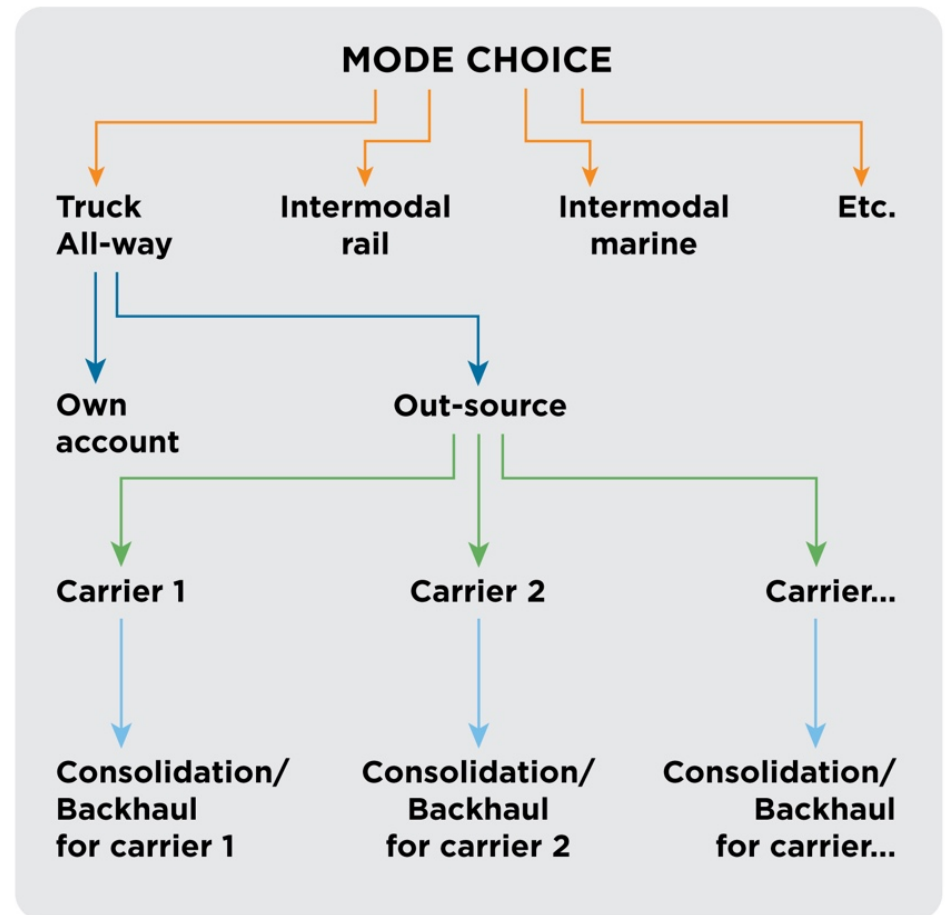

STEP 1

Supplier decides

- to deliver goods using their own fleet or
- to outsource goods movement to a carrier

STEP 2

Then an individual carrier is selected

Carrier Choice

- Allows for explicit matching of loaded trips
- Improves performance by
 - consolidating shipments
 - maximizing fleet utilization
 - minimizing empty backhauls
- Forecasts the necessary empty truck repositioning trips

Truck deliveries can include backhauling and consolidation.

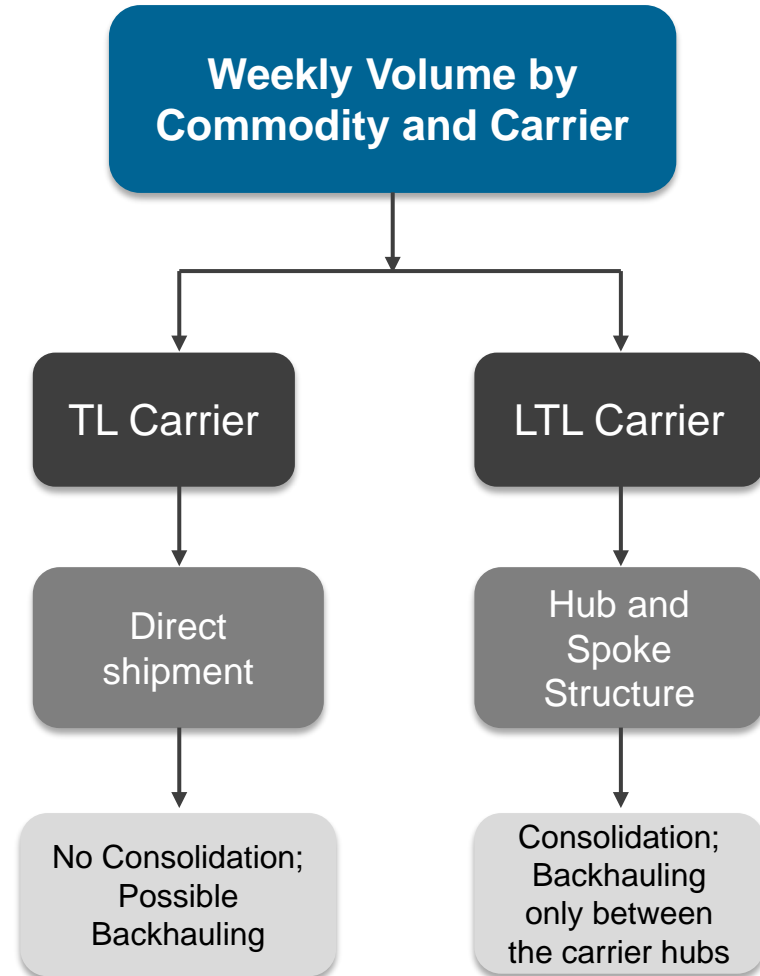

- Operational model that accounts for vehicle return trips and truck transfers
- Each carrier company primarily operates either Truckload (TL) or Less-than-truckload (LTL)
- Backhauling
 - considered on return from destination to origin zone, with a buffer
 - account for either backhauls or empty return trips

Backhauling and consolidation is segmented by truckload carrier.

- Truckloads (TL) follow a direct transport network from origin to destination
- Less-than-truckload (LTL) shipments flow through a distribution chain

The national freight model enhances supply chain methods in several innovative ways.

MACROECONOMICS

- Evolution of global business supply chains
- Focus on buyer-supplier relationships in procurement markets

SEGMENTATION

- Industries
- Carrier choice
- Establishment and firm relationships

TRANSPORT CHAINS AND LOGISTICS

- Including pipelines with air, rail, water and truck
- Operationalizing backhauls

IMPLEMENTATION

- Application software to demonstrate

Summary

- Exploratory research allows for testing of new methods
- Expands on previous research to allow scenario testing of global trends, investments, new technologies, and national policies
- Demonstration software moves this research towards practice
- Data recommendations will provide a road map to improving data collection for freight
