

NHTS Data for Transportation Applications Workshop

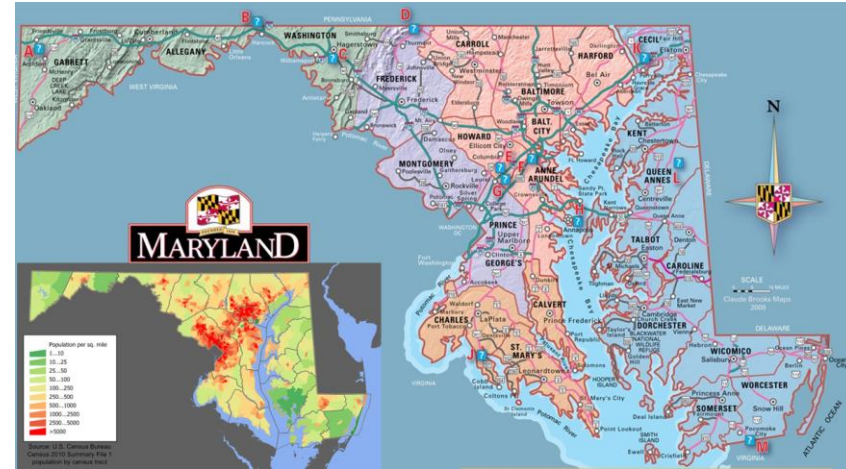

Roundtable: Using the NHTS for Performance Measures

August 8-9, 2018
Transportation Research Board
Washington, DC

Subrat Mahapatra

Major Trends in Maryland

- Maryland VMT is at all time high (60 Billion in 2017)
- B-W region is one of the most congested regions
- Oversaturated conditions leads to higher unreliability
- State is home to 6.1 million people.1 million more people in coming 20 years
- 30% increase in overall VMT and truck VMT to double by 2040

Maryland - America in Miniature

Challenges & Opportunities

- **Customer needs are more diverse and wide ranging**
(demographic shifts, aging population, mobility needs)
- **Travel behavior and decisions are changing rapidly**
(where/ how we live, work, shop and travel)
- **Technology is playing a huge role**
(TNCs, CAVs, ATM /ATDM, Freight)

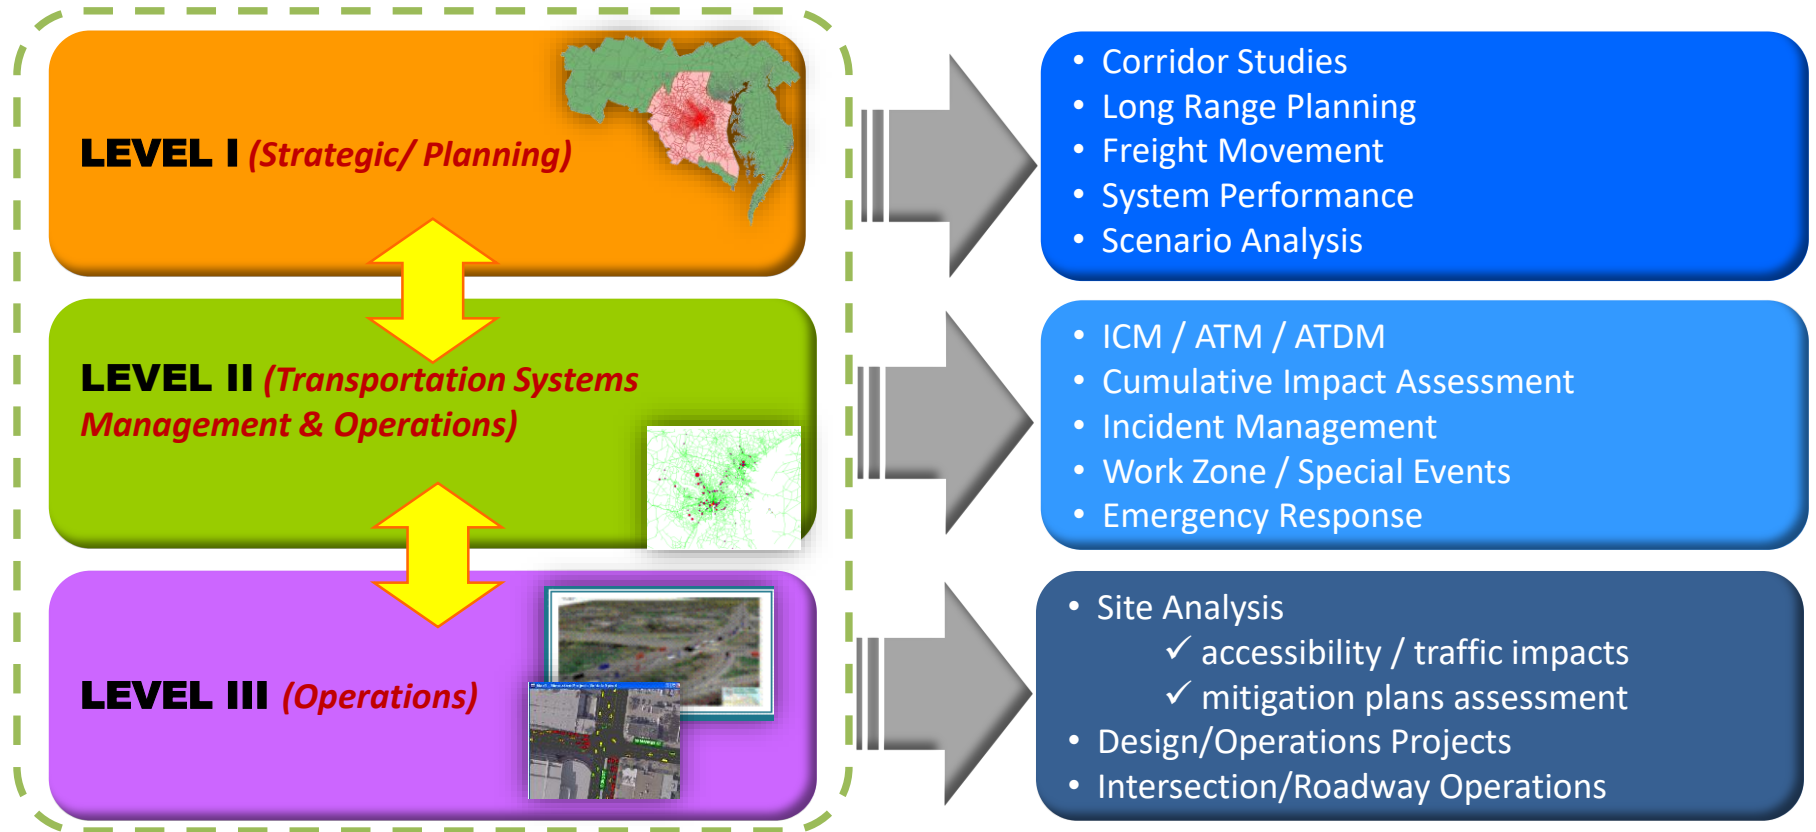

DOT focus on **performance management and customer service...**

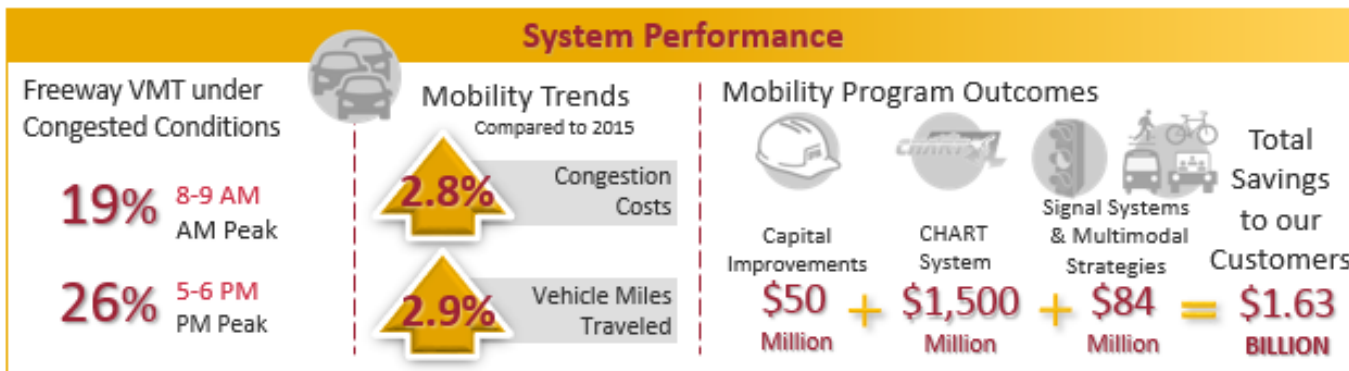

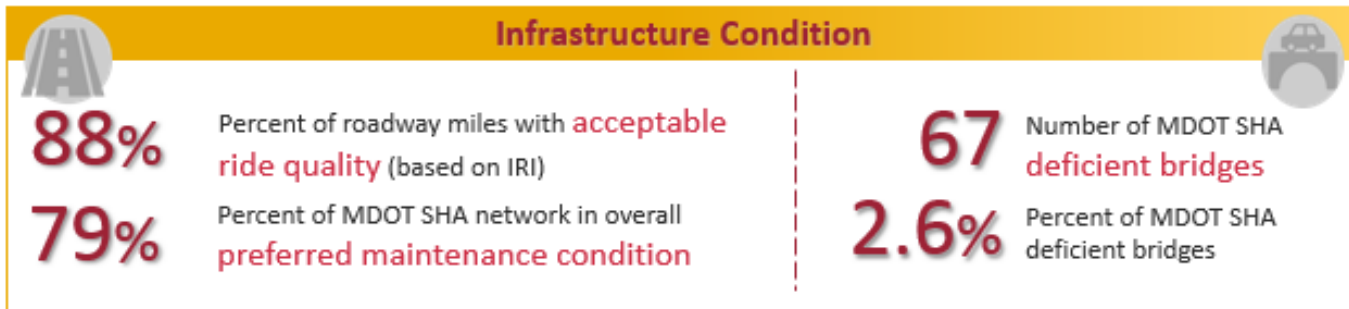

Challenges & Opportunities

- **Aging Infrastructure, Competing Needs** for Funding
- DOT focus on **system efficiency and reliability** (*moving away from planning for average weekday to a typical day*)
- Provide a safe, reliable and efficient **door to door travel experience**
- **TSM&O Implementation** success depends on customers and their choices (*destination, departure time, route, mode*)
- **Communication** - *Telling our Story is very important*

Transportation Decision-making Context

Performance Measures

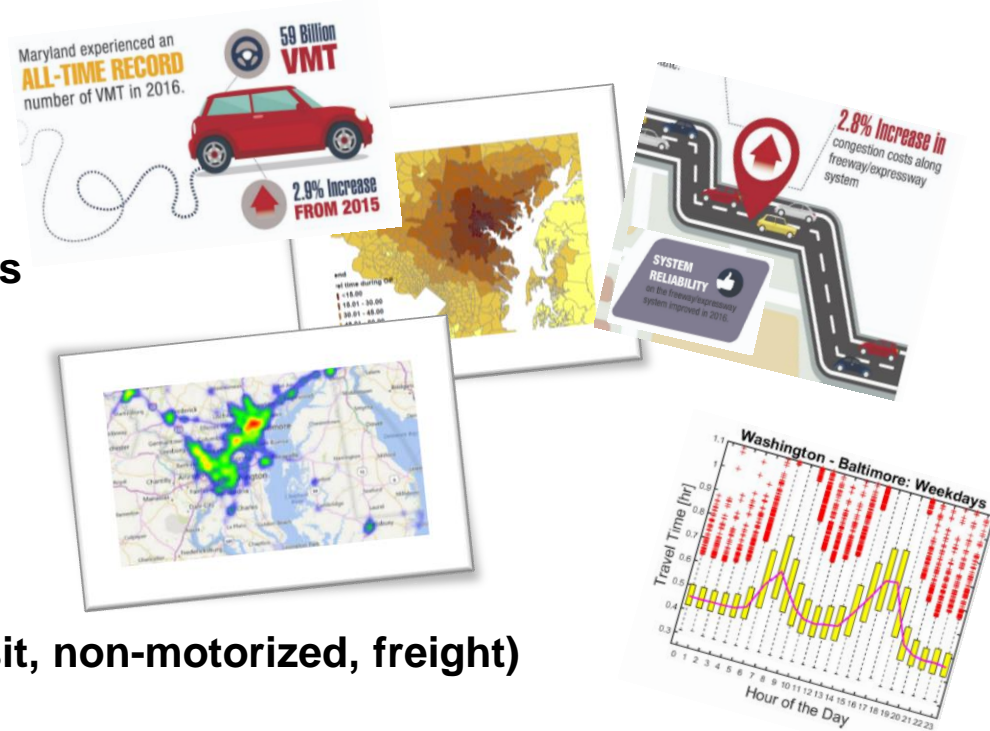

Performance Measures

TRADITIONAL MEASURES

- ADT/ VMT
- Vehicle/ Person Delay/ Congested Miles
- Vehicle/ Person Throughput
- Average Incident Clearance Times
- Annual User Savings

NEWER MEASURES

- Accessibility/ Connectivity (auto, transit, non-motorized, freight)
- Reliability (auto, transit, truck)
- Market Segments (commuters, businesses, freight)
- Quality of Life/ Sustainability
- Economic Indicators
- GHG Emissions

Fluctuations in Demand

Crashes

Inclement Weather

Work Zones

Poorly Timed Traffic Signals

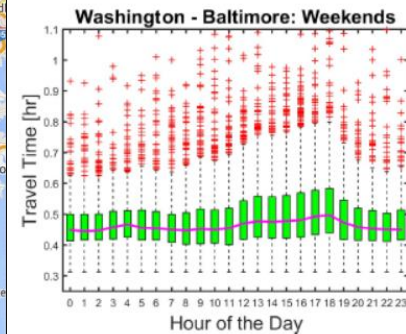

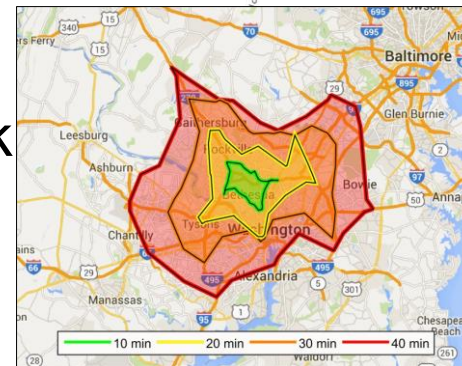

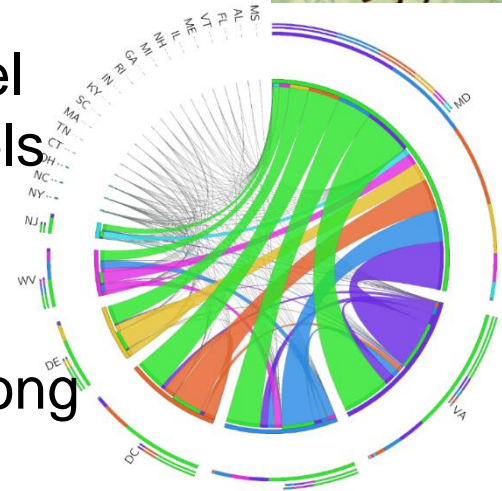

Maryland DOT Use of NHTS Data

- Travel Behavior/ Characteristics by variables
- Trip making (O/D, commuting patterns), mode choices, vehicles ownership, trip lengths by purpose, travel costs, preferences etc.
- Estimating and validating traveling public's responses to policy changes (tolls/fares, capacity improvements, incentives, services, etc)
- Calibration/ Validation of Travel Demand Models

Informing policy making and transportation investment decisions

Big Data Applications

- Estimate O-D matrices (state, county, zip code, TAZ)
- Calibrate/ Validate statewide travel demand models, Integrated Models
- Compute trip-based performance measures (TTI/ PTI)
- Determine distribution of traffic along major routes, activity centers
- Estimate traffic volumes
- Accessibility Metrics (peak/ off-peak by mode)

Going Forward...

- **Conventional data sources and traditional surveys are not enough...Big data provides a window into our customer needs**
- Big data applications for transportation decision-making is **still in infancy**. Needs champions, investment and **commitment for mainstreaming**
- **Collaboration** between agencies (DOTs, MPOs), Data Providers and Research Community (TRB, universities) needed
- Most likely early implementation will happen in **TSM&O and Performance Management areas**
- **Need for Advanced research** to combine traditional data sources with big data for travel behavior analysis
- Need to demonstrate the **value added and sustainability**
