- How we think about info graphics
- Opening data for experimentation

Carte Figurative des pertes successives en hommes de l'Armée Française dans la campagne de Russie 1812-1813.

Dressée par M. Méneard, Inspecteur Général des Ponts et Chaussées en retraite. Paris, le 20 Novembre 1869

Les nombres d'hommes présents sont représentés par les longueurs des zones colorées à raison d'un millimètre pour dix mille hommes; ils sont de plus écrits en lettres des zones. Le rouge désigne les hommes qui entrent en Russie, le noir ceux qui en sortent. Les renseignements qui ont servi à dresser la carte ont été puisés dans les ouvrages de M. M. Chiers, de Légar, de Fozzondac, de Chambray et le journal inédit de Jacob; publication de l'Armée depuis le 28 Octobre.

Pour mieux faire juger à l'œil la diminution de l'armée, j'ai supposé que les corps du Prince Jérôme et du Maréchal Davout qui avaient été détachés sur Minsk et Mielnik et qui rejoignirent Orscha et Wilna, avaient toujours marché avec l'armée.

Women misjudge colon cancer risk

This year more than 50,000 people in the USA will die from colon cancer. Men and women over 50 are equally likely to develop the disease, but only a percentage believe they are at risk.

Source: American Cancer Society

For many, a sealed fate ...

The fate of nearly everyone inside the World Trade Center was sealed the moment the hijacked jets struck on Sept. 11. All but four people at or above the crash zones died. Nearly everyone below lived. Most people died in the north tower, which was hit first. But more than 1,000 people used the

16½-minute gap between the first and second crashes to evacuate the south tower's upper floors. Nearly 500 rescue workers lost their lives when the towers collapsed. Here's how the evacuation unfolded:

The north tower

Everyone on floors 92 and up died; 99% of those below lived. American Airlines Flight 11, carrying 92 people, struck at 8:46:26 a.m. The jet stalled from the north, slightly angled, and crashed into the 5 and through 96th floors. Of those working or visiting the tower at the time, 1,434 died.

The south tower

Only four people on the 81st floor or above survived; they used an unblocked stairway to escape. All but four of the 599 who died in the south tower worked above the impact zone. United Airlines Flight 175, carrying 65 people, struck from the south at 9:02:54 a.m. The jet, sharply angled, crashed into the southeast corner from the 78th through 84th floors. Dozens died in a 78th floor elevator lobby, where they had gone to evacuate after the crash in the other tower.

A narrow escape

Flight 175 destroyed two of the three stairways in the impact zone. But Stairway A, farthest from the crash, remained unobstructed from the top to the bottom of the south tower. A small number of people escaped down the stairway: several from the 78th floor elevator lobby, where dozens died, plus four from above. An unknown number of people climbed the stairs toward the roof in search of a helicopter rescue that never came.

The layout of the 78th floor:

... for thousands of others, a miracle escape

More than 6,000 were feared to have died in the World Trade Center attacks, but that figure was based on missing-persons reports compiled by New York City police. A USA TODAY count shows the toll was fewer than 3,000, including 2,180 building occupants.

Where victims worked or were located:

Note: Floors could not be determined for two victims in the north tower.

Forces behind Katrina's fury

A combination of factors made Hurricane Katrina and its aftermath particularly devastating:

► The storm swung southwest across Florida, then drew extra strength as it crossed an unusually warm current in the Gulf of Mexico.

► Katrina's path came it directly across a major source of U.S. crude oil and natural gas production, refining and distribution.

► By slamming head-on into the Gulf Coast just east of New Orleans, Katrina funneled its fury into several bays where water rose with deadly effects.

Flood wall repair continues Sunday.

► Finally, Katrina's path allowed its winds to roar south across swollen Lake Pontchartrain. That piled water against the most vulnerable flood-control barriers of a city situated largely below sea level.

Graphic research by Paul Overberg and April Koenig; graphics by Dave Merritt, Karl Geller and Robert A. Ivers

New Orleans flood wall failure

Water spilling over floodwalls ate at the foundation until large sections collapsed.

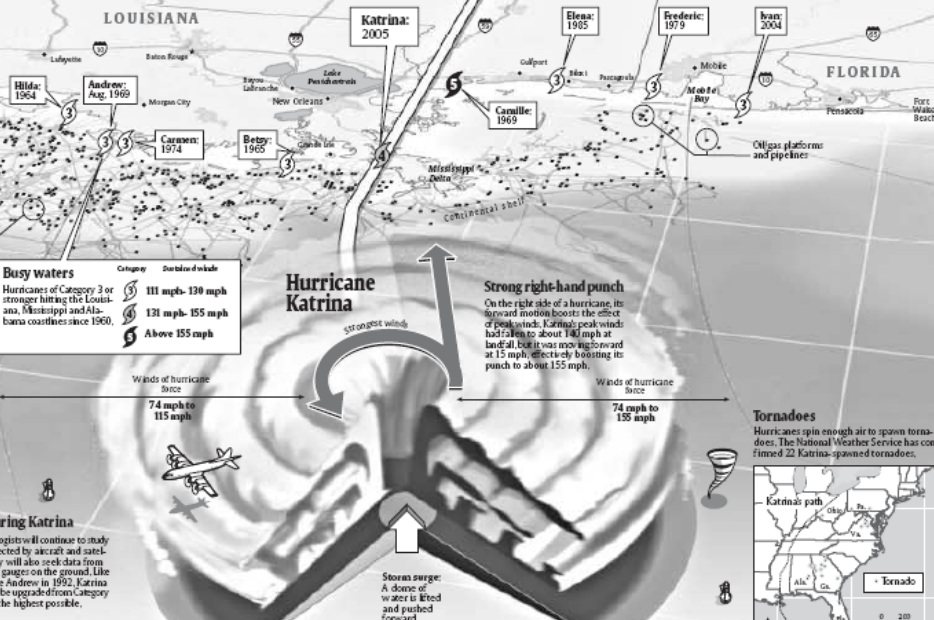

Energy

All of the region's 19 oil platforms and 137 drilling rigs were evacuated. By Monday afternoon, 28% were still unpowered. Four of 13 Gulf Coast refineries had resumed operations, some with oil from the Strategic Petroleum Reserve.

Storm surge

By creating low atmospheric pressure, a hurricane lifts the sea level. This dome of water rises to destructive heights at landfall. Katrina's storm surge peaked at more than 20 feet near Biloxi and Gulfport, Miss., not including waves. Lesser surges were measured more than 100 miles to the east and west.

Measuring Katrina

Meteorologists will continue to study data collected by aircraft and satellites. They will also seek data from damaged gauges on the ground. Like Hurricane Andrew in 1992, Katrina may later be upgraded from Category 4 to 5 - the highest possible.

Gambling and cruising

Two major cruise ships are based in New Orleans. Its port would lose \$15 million to \$20 million from their diversion for three months. Louisiana will lose about \$5 million in revenue each month that New Orleans' three riverboat casinos don't operate. Mississippi's 13 of its 29 floating casinos and will lose about \$15 million a month in revenue.

Slicing the storm

An automated weather station on Bayou LaBranche, just off Interstate 10 west of New Orleans, recorded Katrina's passage.

Tornadoes

Hurricanes spin enough air to spawn tornadoes. The National Weather Service has confirmed 21 Katrina-spawned tornadoes.

Tracking the storm

Crude oil per barrel daily U.S. market close: \$67.51

How we vote

Americans have moved away from punching a card or pulling a lever to cast a ballot. A look at the changes in types of voting equipment used in 2000 and 2010.

Voting equipment by county

■ 2000
■ 2010

- **Punch card:** Voters insert blank cards into machines that list ballot choices. Then they punch out pre-scored holes to record their votes.
- **DataVote:** Voters punch holes next to choices printed on a ballot card.
- **Lever machine:** Voters push small levers to indicate choices. Then they pull a different, larger lever to record their votes. No longer manufactured.
- **Paper:** Voters mark boxes next to their choices and drop ballots into a sealed box.
- **Optical scan:** Voters indicate choice by shading empty rectangles, circles, ovals or arrows. Ballots are tabulated by scanner machine.
- **Electronic:** Voters touch computer screens or push buttons to record their votes automatically.
- **Mixed:** A combination of methods.
- Not available**

Census

The USA TODAY Census API allows developers to easily and programmatically access United States Census information. Data concerning ethnicity, housing, population and race is available from both the 2000 and 2010 census, as well as basic population numbers dating back to the original 1790 census. All data returned in JSON formatting. Please refer to our documentation below which describes in detail how data can be requested and returned. We welcome your feedback, so please contribute to our [forum](#) or contact us at api@usatoday.com.

Note that usage of the USA TODAY Census API requires a developer key, and that usage is contingent upon agreement with our [Terms of Use](#). Access to the Census data is limited for our open API, as only 2010 Census data will be accessible. If you are interested in full access to the Articles API, please contact us directly at api@usatoday.com.

■ About the Data

Methodology: USA TODAY collected summary data files from the U.S. Census Bureau for censuses from 1790 to 2010. It extracted categories of broad interest for 35,000 of the most well-known geographical areas. The data was extensively cross-checked to allow comparisons, including revisions of geographical coding where necessary. The data was enhanced by calculating percentages and adding indexes to summarize complicated data in a single variable. One example is the USA TODAY Diversity Index, which measures on a 0-100 scale the probability that two randomly chosen people from an area will have different racial or Hispanic backgrounds.

Geographical coverage: Data is provided for the United States; the states and the District of Columbia; counties and equivalent areas (census areas and municipalities in Alaska; the District of Columbia; parishes in Louisiana and independent cities outside of any county in Md., Mo., Nev., and Va.); cities and unincorporated areas, collectively "places"; and county subdivisions in 12 states where they act as full local governments: Conn., Maine, Mass., Mich., Minn., N.H., N.J., N.Y., Pa., R.I., Vt. and Wisc. Data is provided only for geographical areas currently in existence.

Dates: Detailed data is provided from the censuses of 2000 and 2010. Limited time series are provided from the censuses of 1790-2010 for counties, states and the United States.

■ Constructing a Call

Every call to the USA TODAY Census API must be authenticated with the programmer's unique API key, as in this sample request.
