# Quantitative Target Setting for Pavement Management Data Quality

Siamak Saliminejad, PhD, PE

Senior Consultant, AgileAssets

7/12/2016

# 01 Introduction

# Why this study matters?

---

## 1. What is the problem?

We don't know what is the acceptable level of quality for pavement condition data.

# Why this study matters?

---

## 2. Who cares?

Transportation agencies, and whoever uses pavement condition data for decision making

# Why this study matters?

---

## 3. What are the benefits of solving the problem?

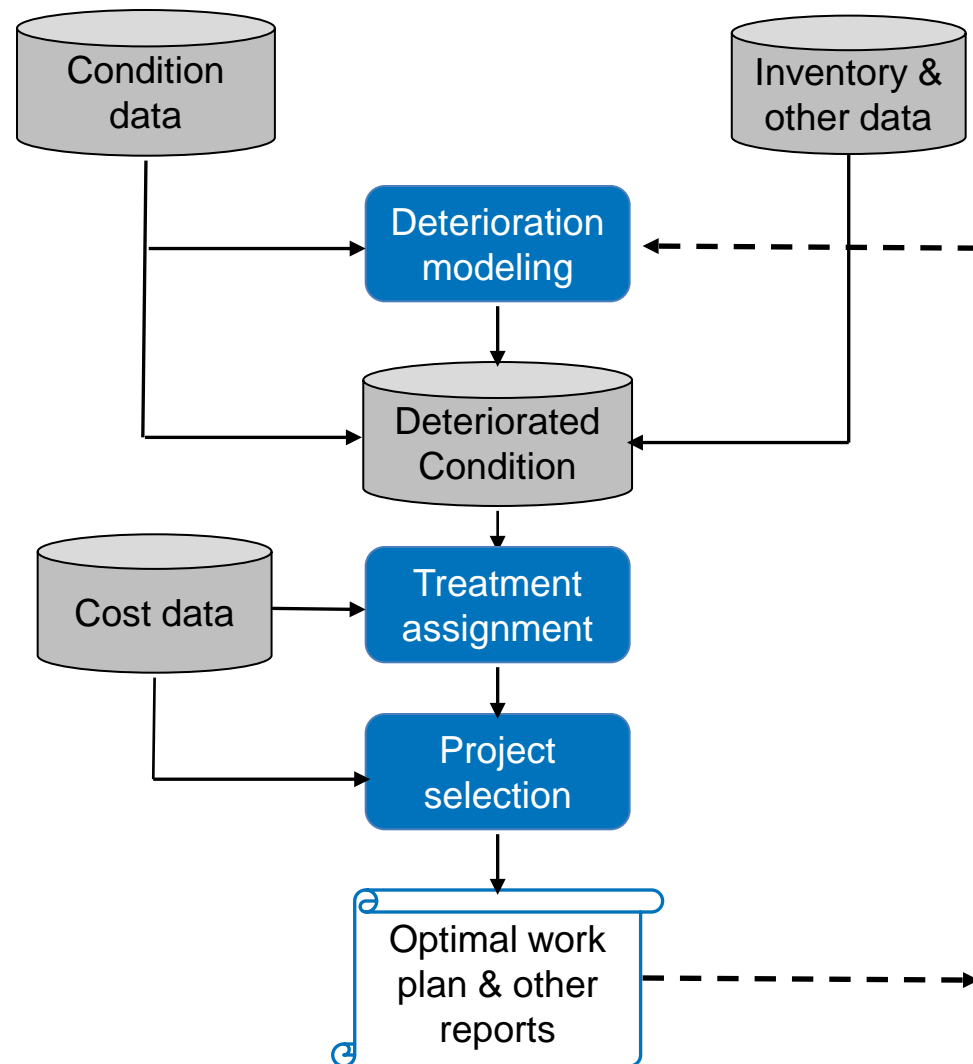

1. Agencies can plan better, and save money.
  2. Citizens will enjoy a network with a higher quality.
- Anything else?

# 02 Pavement Management System

# Pavement Management System (PMS)

A set of tools or methods that assist decision-makers in finding optimum strategies for providing, evaluating, and maintaining pavements in a serviceable condition over a period of time (AASHTO)

# 03 Literature Review

# Variability in Infrastructure Condition Data

## Observations from Literature

- “The issue of variability inherent to visual asset condition assessments is a recognized limitation of these evaluations” (Migliaccio, 2011).
- “Distress data variability has been a critical issue in improving the effectiveness of PMS” (Bogus, 2010)”.
- “Pavement condition data quality can be bad enough to be completely useless” (Larson et al., 2009).
- “Variability of pavement surface distress data collection has always been an area of significant concern” (Daleiden, 1998).
- “Distress data variability exists and it can potentially be quite large” (Rada, 1997).
- “The visual inspection method, being subjective, is prone to personal bias and lack of consistency and repeatability” (Prakash, 1994).

# Why is Pavement Condition Data Variable?

---

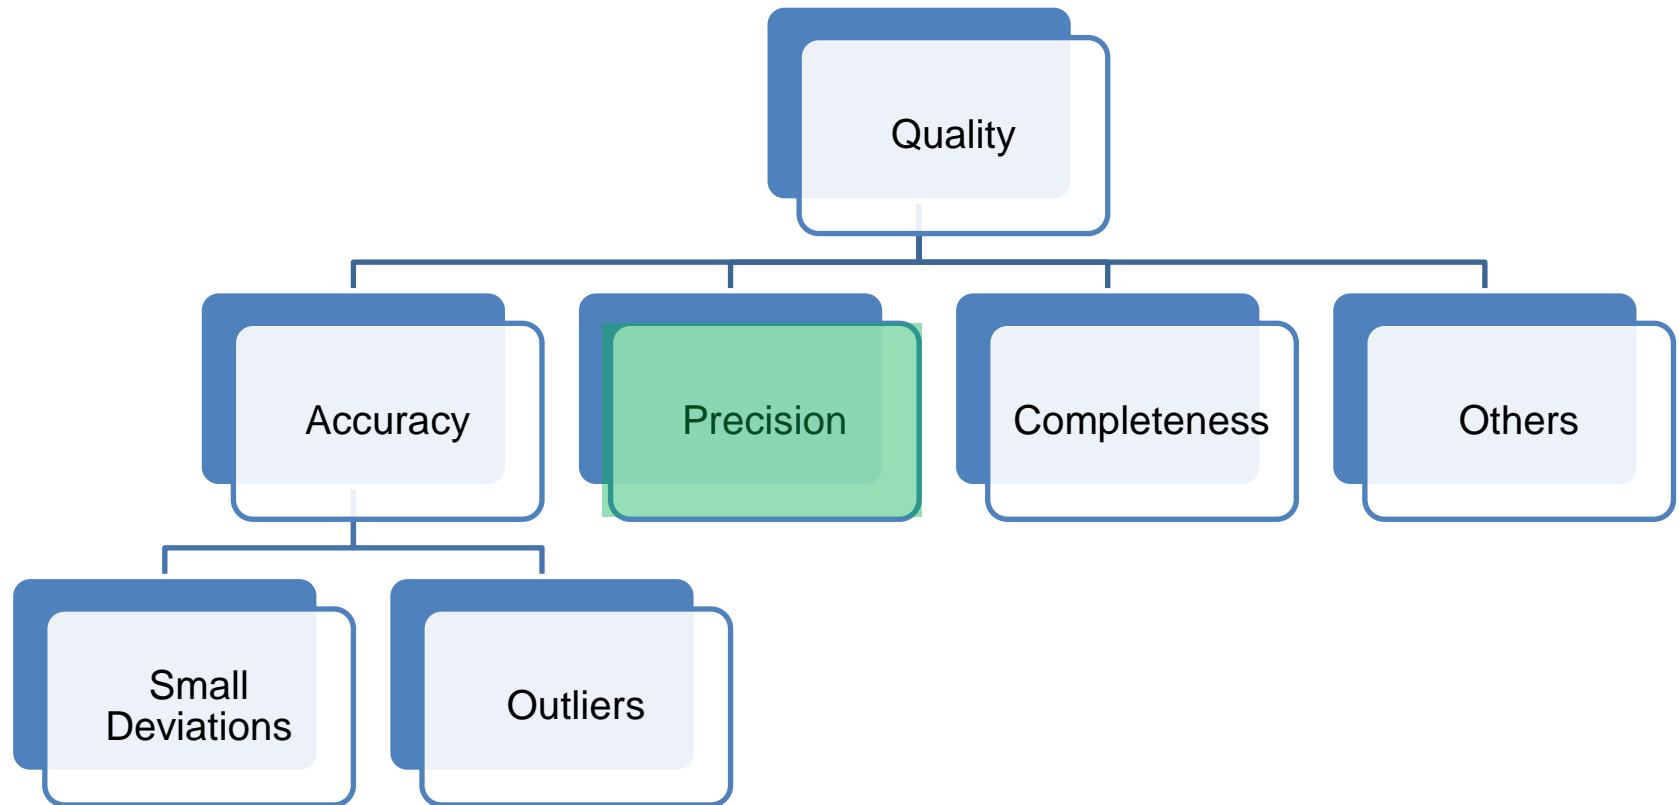

In the case of pavement, several factors can affect the quality of condition data:

- Shape and condition of each pavement section (*Flintch and McGhee 2009*).
- Bias toward detecting higher-severity distresses, while missing lower-severity distresses (*McQueen and Timm 2005*).
- Data collection method (*McGhee, 2004*)
- Inability of images and videos to catch thin cracks (*Morian et al. 2002*).
- Weather condition, direction and the angle of sunlight, temporary healing of cracks in summer (*Smith et al. 1998*).

# 04 Data Quality

# Aspects of Data Quality

**Accuracy:** The difference between a measurement reading and the true value of that measurement“ (NIST, 2003).

**Precision:** The ability of a process to repeat the same accurate measurement over time (NIST, 2003).

# Data Quality Assurance

---

1. Collecting original data
2. Collecting audit data
3. Calculate difference between original and audit data
4. Compare the difference with the **target**
  - 95% of the collected data to have an absolute deviation of less than 10 points (out of 100) between audit and original data

# 05 The Study

- Objective
- Simulation
- Assumption
- Results

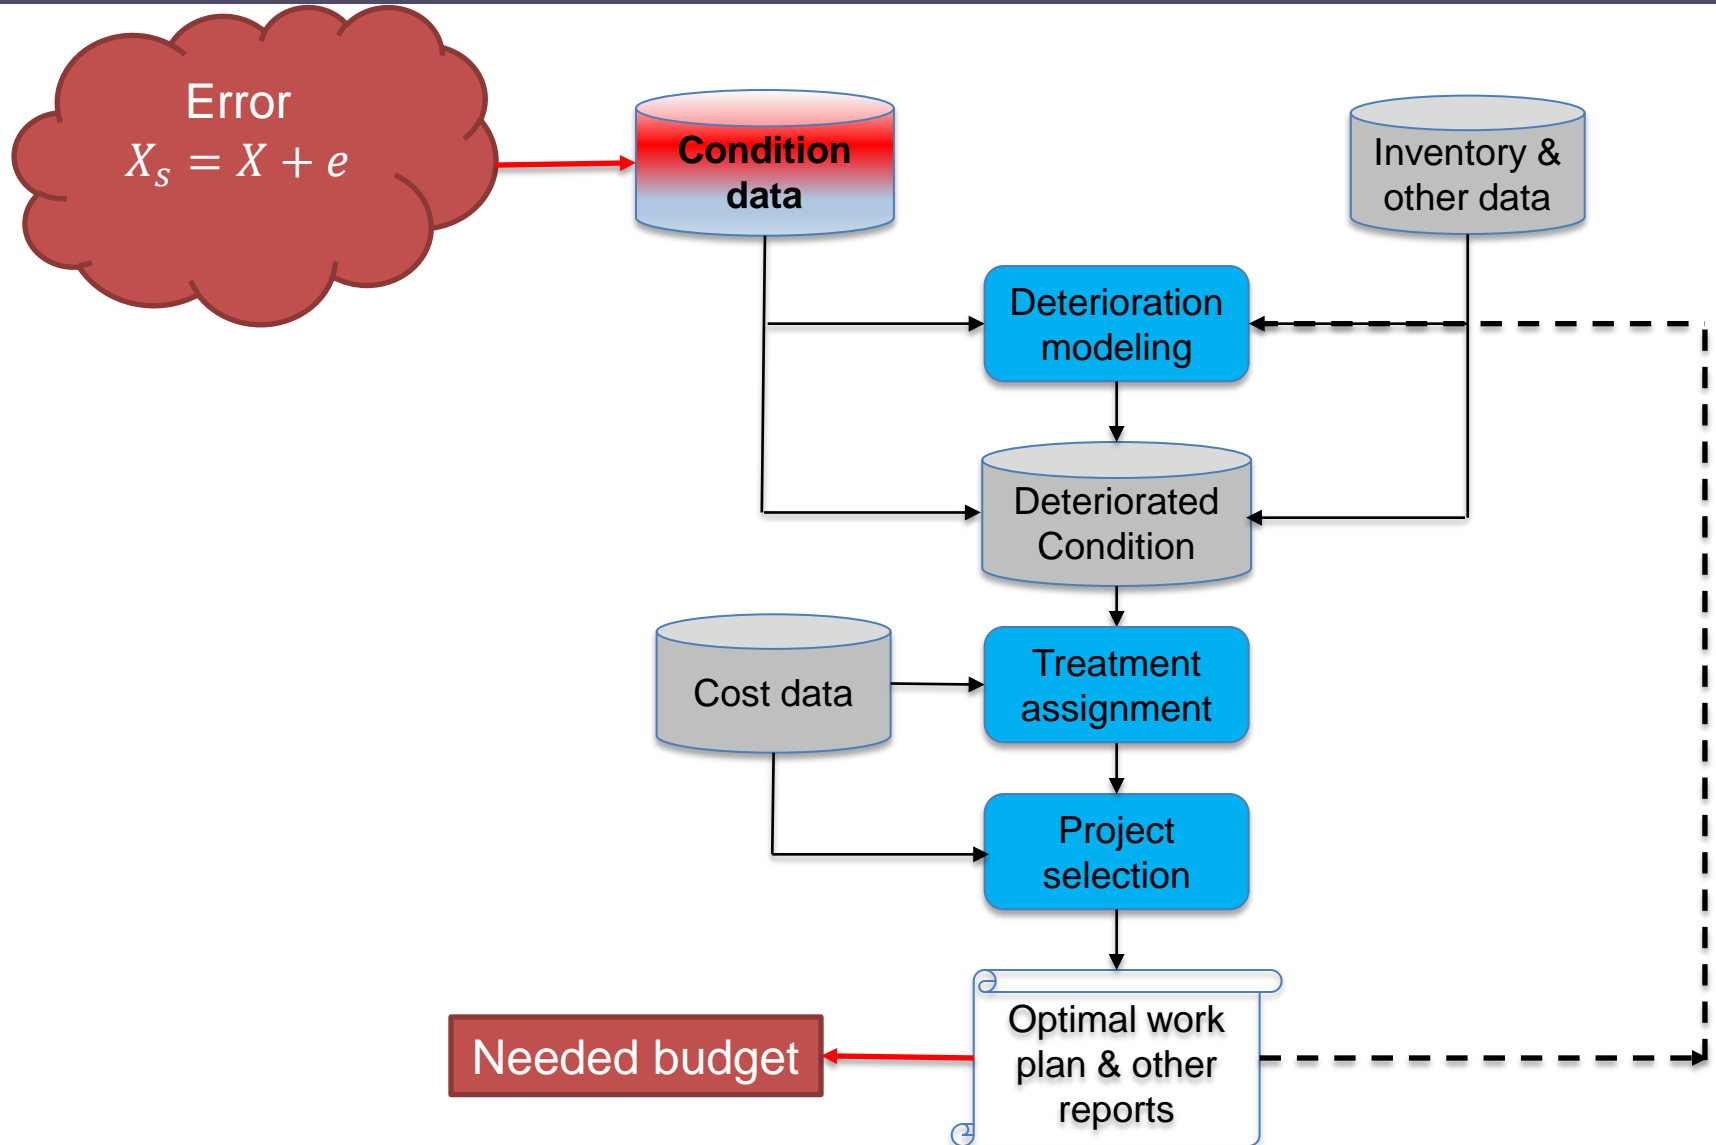

# Study Objective

---

- Assess the Impact of Pavement Condition Data Quality target on the Accuracy of PMS output
- PMS and DB: Two states systems: PMS-1 and PMS-2
- PMS Output:
  - Needed Budget: Minimum budget needed to keep the weighted average condition index (CI) of the network above 85 and while not allowing more than 5% of the network length to be in poor performance level (CI<40).

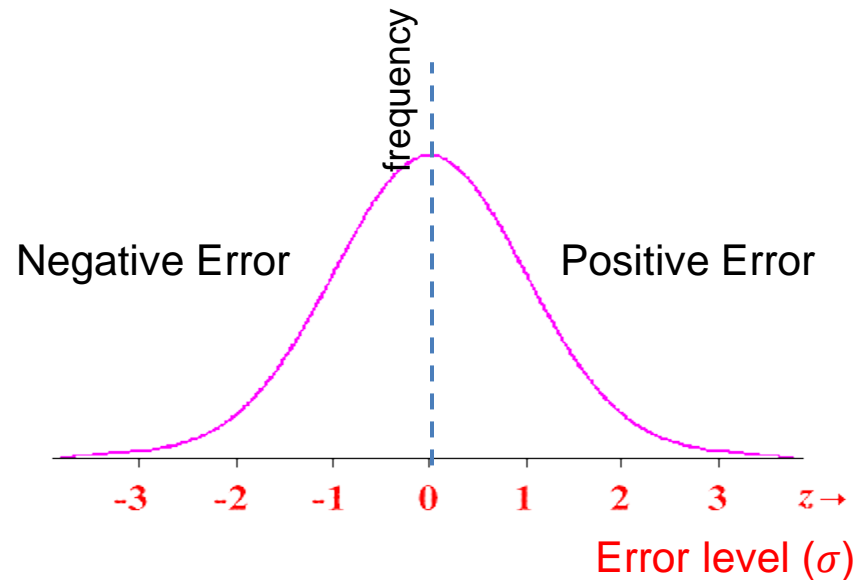

# Simulation

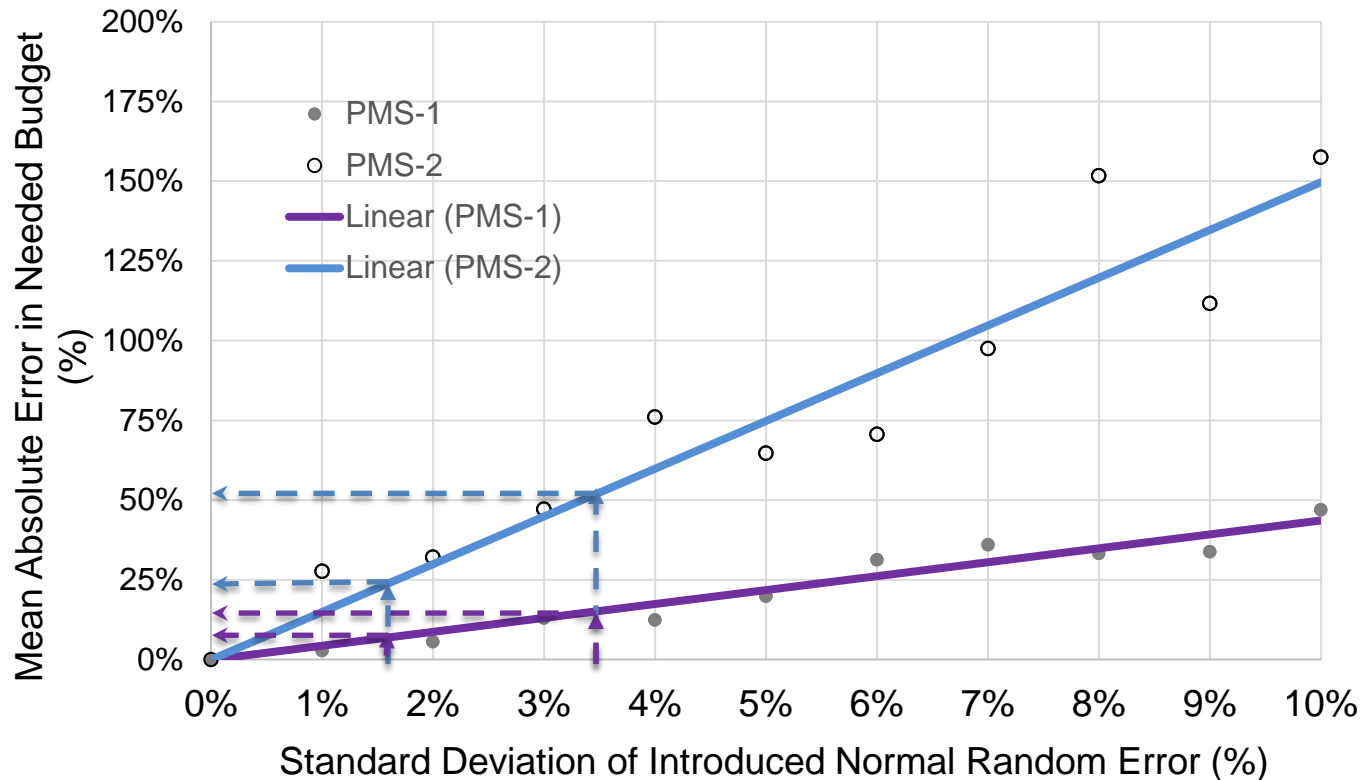

# Assumption

Assumption: Error in original and audit data are normally distributed with the same error distribution

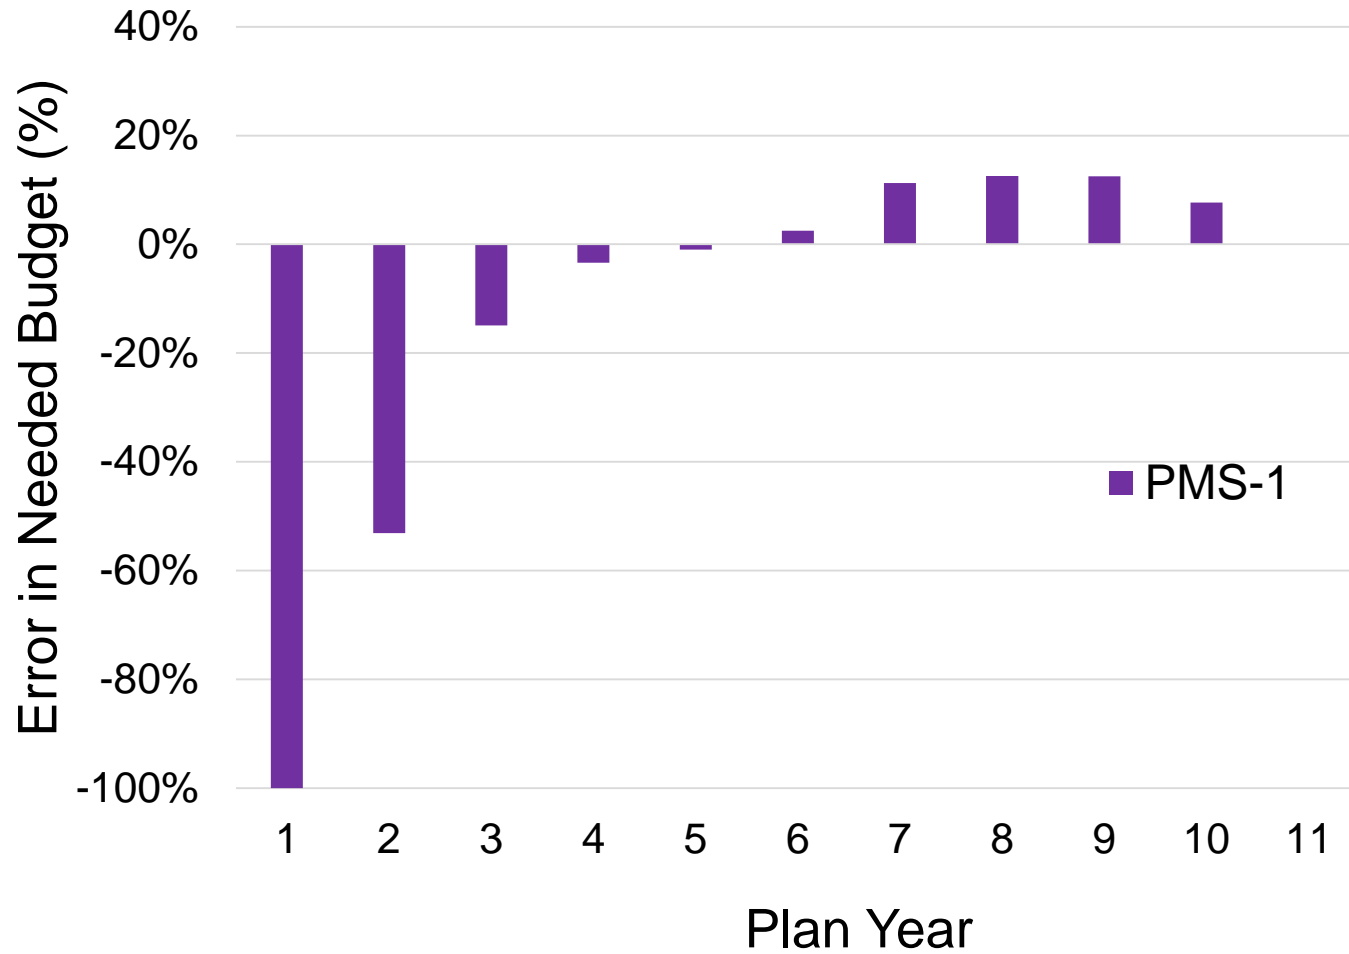

$$\text{audit-original} \sim N(\mu, \sqrt{2}\sigma)$$

# Simulation Results

Example target: 95% of the collected data to have an absolute deviation of less than 50 points between added and original data ( $\sigma=3.5$ )

# Simulation Results

# Simulation Results

# 06 Summary and Conclusion

# Summary and Conclusions

---

- Agencies need to know sensitivity of their decisions to different levels and types of errors.
- Error in condition data can highly distort PMS outputs especially when it occurs on larger sections.
- Investing on providing higher quality condition data is beneficial.
- Agencies should consider having a more conservative data quality acceptance criteria for larger pavement sections.
- Different systems have different sensitivity to errors.
- The consequences of PMS input data error for PMS outputs persist throughout the planning period and can fluctuate (i.e. change direction)

# Future Works

---

- Study interaction between errors
- Study non-normal errors

Thank You.
