

Developing Maintenance Cost Models based on Asset Condition

Dave Solsrud– Asset Management Project Manager

11th National Asset Management Conference

July 12, 2016

Minneapolis Marriot City Center

Life-Cycle Costs

Iceberg

Initial Capital Expenditures

Maintenance Costs

Future Capital Costs

Operational costs are not part of LCC, but are part of overall management \$

Background image: http://www.pvisoftware.com/blog/wp-content/uploads/2013/11/Pegasus_vertex_Iceberg.png

Goals for Data

- Life Cycle Cost Scenarios
 - Capital strategies = predicted cond. = Maint. \$'s
 - Best practices – economically analyzed, deterministic
- Capital Investment Scenarios
 - Predicted system condition, maintenance costs
 - Tradeoff efforts
- Budgeting by Products and Services
 - Needs driven
- Local Work Planning
 - Labor hours, costs by Season/District

Asset Classes Addressed

- ▶ Pavements (Bituminous NHS and Non-NHS)
- ▶ Bridges (Trunk Highway Deck bridges)
- ▶ Culverts (< 10' span Mainline pipes)
- ▶ Overhead Sign Structures
- ▶ Tower/High Mast Lighting Structures

General Approach

1. Determine Strategy: collect and correlate expended costs to asset condition.
2. Evaluate Asset Information Available
3. Determine Cost Information Needed – Level of Detail
4. Build recording tools
5. Train Workforce
6. Validate Data – Real-time processes
7. Analyze Data – correlations – models

Asset Management Cost Models - Pavement

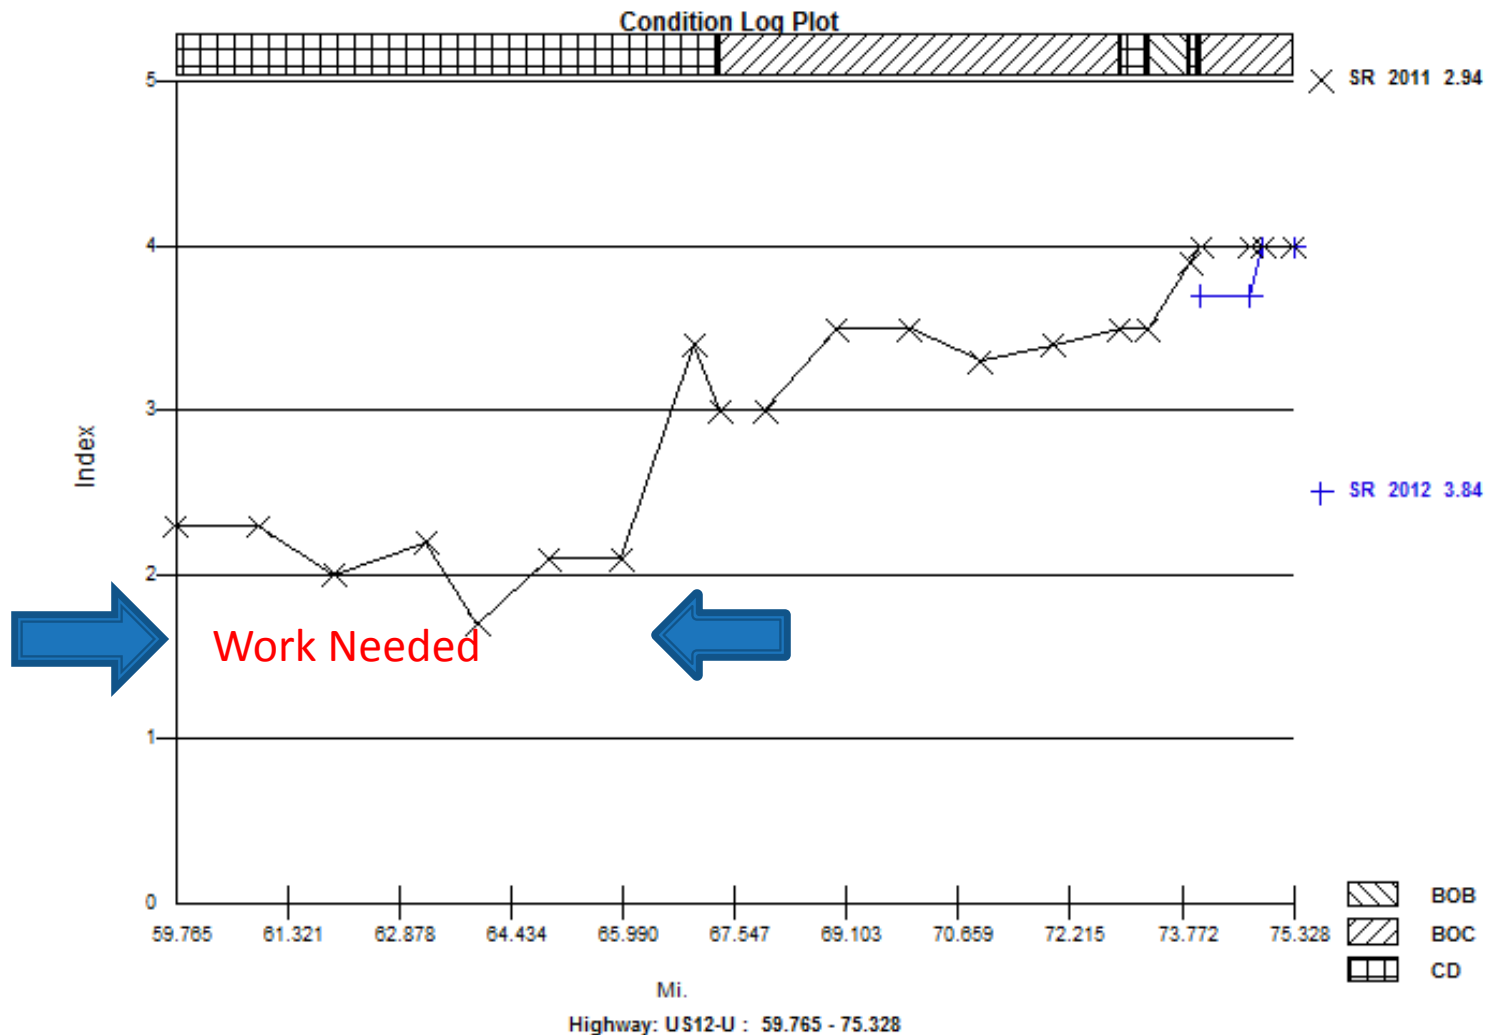

MnDOT Pavement Maintenance

- Random Pothole Patching
- “Heavy” patching (Skidloader/Roller)
- “Ribbon Paving” (Bellydump Semi’s)
- Crack Sealing
- “Mastic” material applications
- “Blow Patching”
- Thin Surface Treatment
- Shoulder Repair

Pavement Condition Info

Pavement Repair Recording

Example:

The screenshot shows the 'EMPLOYEE TIMESHEET' application. At the top, there are fields for 'PPE DATE' (06/03/2014) and 'EMPLOYEE ID' (00396930). Below these is a 'MILEPOINTS' dialog box with the following fields: 'REF POINT FROM' (084+00.000), 'REF POINT TO' (084+00.500), and 'INCR DECR INDC' (UNDIVIDED). A dropdown menu is open for 'INCR DECR INDC', showing options: INCREASE, DECREASE, UNDIVIDED (highlighted), RAMP, LOOP, INTERCHANGE, and OTHER. The 'MILE PNTS' tab is selected at the bottom of the dialog. To the right, a table lists activity entries:

PROJECT ID	ACTIVITY ID	SRC	TYPE	DESCRIPTION	HOURS
TL000	LABORADDITIVE	0039		HOLIDAY	8.00
TP8A012A	MAINTPLOW	2101		LIGHT PATCHING	1.00
TP8A012A	MAINTPLOW	2102		PATCHING	1.00
TP8A012A	MAINTPLOW	2103		HEAVY PATCHING	1.00
TP8A012A	MAINTPLOW	2105		BLOW PATCHING	2.00

At the bottom of the interface, there are tabs for 'FUND INFO', 'OVERTIME', 'MTRL USAGE', 'EQ USAGE', 'SHFT DIFF', 'ACCOMP UNIT', 'MILE PNTS', and 'DATE/TIME COMPLETED'. The 'MILE PNTS' tab is currently active.

Reference Points:

****Enter to the tenth of a mile the "FROM" and "TO" Reference Points.**

- Roadways Associated with Interchanges: Estimate from mainline adjacent to the work.
- Frontage Roads or Other Pavement: Estimate adjacent mainline.

Click on the "MILE PNTS" tab to open the box manually.

- **Multi-lane Road:** Select "Increase" or "Decrease", should coincide with direction of work being done (i.e. north/south or east/west).
- **Two-lane/Two-way:** Select "Undivided".
- **Roadways Associated with an Interchange:** Select "Ramp, Loop, Interchange".
- **Frontage Road or Other Pavement:** Select "Other".

Pavement Data Modeling – Surface Rating

(sample data only)

Pavement Maintenance Cost Model

Pavement Maintenance Resource Demand Model

2015

Pavement Condition	Surface Rating Low Value	Surface Rating High Value	Labor Hours per Lane Mile *	Project Full Cost per Lane Mile
Very Poor	0.0	1.0	31	\$4,650
Poor	1.1	1.6	24	\$3,800
Fair	1.7	2.4	17	\$2,950
Good	2.5	3.7	9	\$2,100
Very Good	3.8	4.0	2	\$1,250

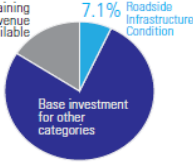

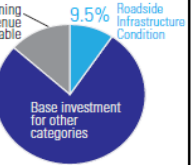

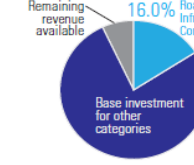

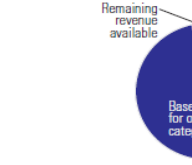

* These values are illustrative only.
Future efforts will refine these values.

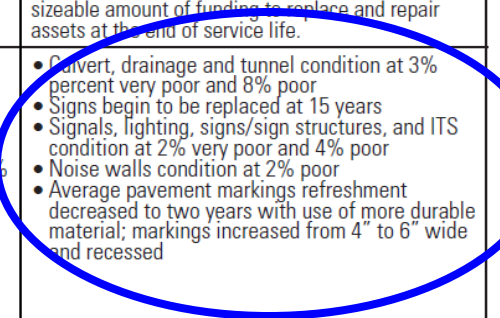

Roadside Infrastructure Condition

Overarching Goal: Effectively manage non-pavement and non-bridge asset infrastructure to support a safe, accessible, and reliable roadway system.

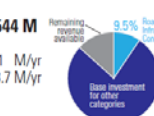

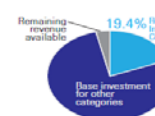

Performance Objectives: Install, maintain, replace and upgrade critical infrastructure elements to manage performance and life-cycle costs to improve efficiency and condition, and reduce risks to the public.

	Performance Level 0 <i>Lowest cost, greatest risk</i>	Performance Level 1 <i>Lower cost, higher risk</i>	Performance Level 2 <i>Greater cost, lower risk</i>	Performance Level 3 <i>Greater cost, lowest risk</i>
Investment Approach <i>(See Approaches Folio)</i>	Approach A, C	Approach B Approximately corresponds with current investment	PL does not correspond with an Investment Approach	PL does not correspond with an Investment Approach
Investment Level <i>Total</i> <i>Years 5-10 (2022-2027)</i> <i>Years 11-20 (2028-2037)</i>	\$1,157 M  \$57.0 M/yr \$81.5 M/yr	\$1,544 M  \$76.1 M/yr \$108.7 M/yr	\$2,596 M  \$127.9 M/yr \$182.8 M/yr	\$3,149 M  \$155.2 M/yr \$221.8 M/yr
Investment Description	Reduction from current funding. Rely primarily on Pavement investment to initiate much of Roadside Infrastructure Condition. Stand-alone work only initiated through maintenance.	Maintain current funding. Rely primarily on Pavement investment to initiate much of Roadside Infrastructure Condition. Some stand-alone work initiated.	Maintain current conditions. Rely on both Pavement investment and stand-alone work to initiate Roadside Infrastructure Condition.	Meet performance targets. Rely on both Pavement investment and stand-alone work to initiate Roadside Infrastructure Condition. Allocate a sizeable amount of funding to replace and repair assets at the end of service life.
Outcomes <i>To what extent would MnDOT meet performance targets for Roadside Infrastructure Condition?</i>	<ul style="list-style-type: none"> Poor culverts increases to more than 15% More than 75% of tunnels will be in poor/very poor condition Reflectivity of most signs below standards - illegible Significant increase in poor/very lighting, signals, and ITS infrastructure - replacement occurs beyond expected service life More than 40% of noise walls in poor/very poor condition or older than design life Significant increase in poor-quality pavement markings 	<ul style="list-style-type: none"> Meet 3% percent very poor target but poor increases to 13% Tunnels in 50% poor and 24% poor condition All signs replaced at or beyond years Increase in poor/very lighting signals, and ITS infrastructure majority of replacements occur end of expected service life 33% of noise walls in poor condition or older than design life Increase in poor-quality pavement markings 	<ul style="list-style-type: none"> 10,000 miles of pavement markings refreshed annually 	<ul style="list-style-type: none"> Culvert, drainage and tunnel condition at 3% percent very poor and 8% poor Signs begin to be replaced at 15 years Signals, lighting, signs/sign structures, and ITS condition at 2% very poor and 4% poor Noise walls condition at 2% poor Average pavement markings refreshment decreased to two years with use of more durable material; markings increased from 4" to 6" wide and recessed
Risks	High <ul style="list-style-type: none"> Replace/repair burden shifts from capital to maintenance budget Reduced reliability leads to system closures - greater interruptions and increased safety risk Delayed replace/repair not aligned with optimal life cycle investments results in increased costs Decreased replace/repair results to an inability to meet public expectations and standards 	Medium <ul style="list-style-type: none"> Replace/repair burden shifts from capital to maintenance budget Reduced reliability leads to system closures - greater interruptions and increased safety risk Delayed replace/repair not aligned with optimal life cycle investments results in increased costs Decreased replace/repair results to an inability to meet public expectations and standards 	Medium <ul style="list-style-type: none"> Delayed replace/repair not aligned with optimal life cycle investments results in increased costs Low <ul style="list-style-type: none"> Replace/repair burden shifts from capital to maintenance budget Reduced reliability leads to system closures - greater interruptions and increased safety risk Decreased replace/repair results to an inability to meet public expectations and standards 	Low <ul style="list-style-type: none"> Replace/repair burden shifts from capital to maintenance budget Reduced reliability leads to system closures - greater interruptions and increased safety risk Delayed replace/repair not aligned with optimal life cycle investments results in increased costs Decreased replace/repair results to an inability to meet public expectations and standards
System Investment Strategies <i>What strategies would MnDOT use to manage risk?</i>	<ul style="list-style-type: none"> Rely on maintenance budget to keep system in good repair Respond to non-functional or very poor condition elements only through pavement and bridge investment 	<ul style="list-style-type: none"> Repair/replace infrastructure in very poor condition or beyond service life Replace assets with greatest exposure to traveling public through pavement and bridge investment and some stand-alone projects 	<ul style="list-style-type: none"> Repair failed infrastructure as needed Replace infrastructure that is functional but damaged/outdated Invest in preventive repairs to avoid future higher replacement costs 	<ul style="list-style-type: none"> Repair/replace infrastructure in poor and very poor condition or at end of service life Long-term replacements made when appropriate Upgrades and innovations to improve functionality and improve life cycle

Includes Preventive and Reactive maintenance activities

Overhead Sign Structures, Tower Lighting

MnDOT Maintenance

- Inventory and Condition Data limited
- Inspection practices codified
- Resource Consumption via Employee Timesheet system
- Data Processed Spreadsheet
- “Resource Demand Models” similar to other assets

Takeaways

- Dedication of resources and clear direction moved the department quickly
- Can now begin to credibly quantify costs
- Data quality is a continual struggle
- Model refinement possibilities unlimited
- AgileAssets (underway) will reduce data recording redundancies and issues
- Movement toward expanded Asset Classes
- Movement toward expanded use of info.
- Oracle BI tool is powerful but expensive

Thank You!
