

## **Two examples of scenario analysis tools:**

**Long term demographics & travel**

**Long distance mode choice with attitudinal variables**

Mark Bradley, RSG

TRB Scenario Planning Conference, Portland, August 2016

# Impact of Socio-Demographics on Travel Demand (NCHRP 20-83 (06) – TRB Report 750)

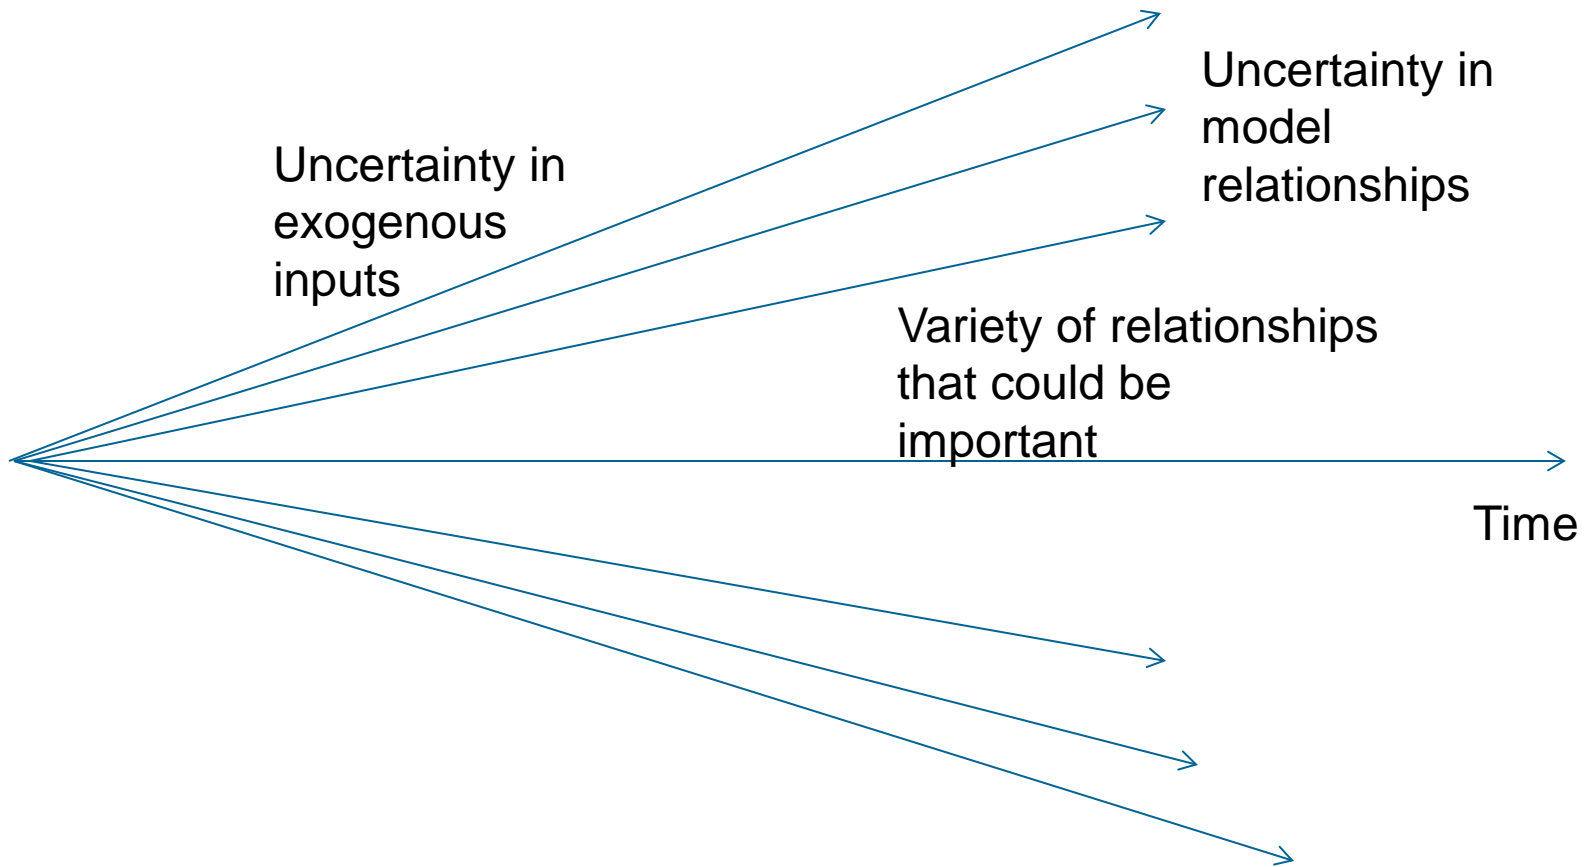

- Research focused on understanding:
  - How the composition of the population might change over time
  - How socio-demographic changes will affect ways in which people travel
  - How assumptions about changes in demographic patterns and travel behavior “play out” over time
  - Which assumptions seem to lead to the most contrast across different scenarios

## Impacts 2050 Is . . .

- A strategic scenario analysis tool
- Comprised of:
  - A Systems Dynamics model that can represent the co-evolution of population, land use, employment, transport supply and travel behavior
  - Scenarios representing divergent visions of alternative futures
- Not intended to replace existing travel demand forecast models

**As a model is run further into the future, precision in the inputs and forecasts becomes less possible, and the ability to represent a wide range of scenarios becomes more relevant**

# Systems Dynamics modeling

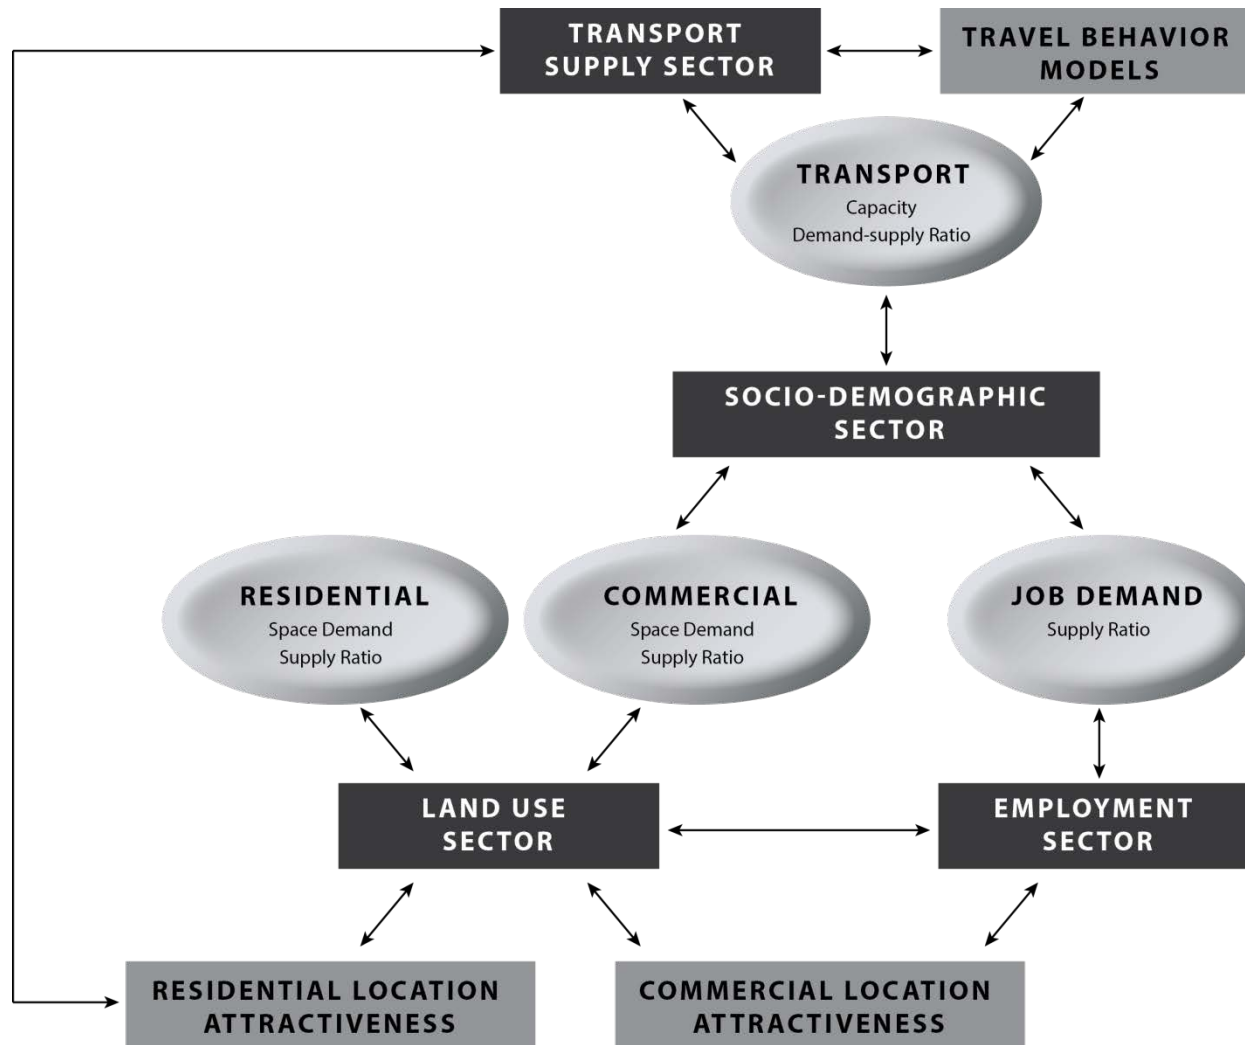

The focus is on relationships between variables over time (*rates of change*)  
Behavior results from feedback between system components (*can be limiting effects or reinforcing cycles*)

Developed at MIT in 1960's for industrial systems (Forrester).

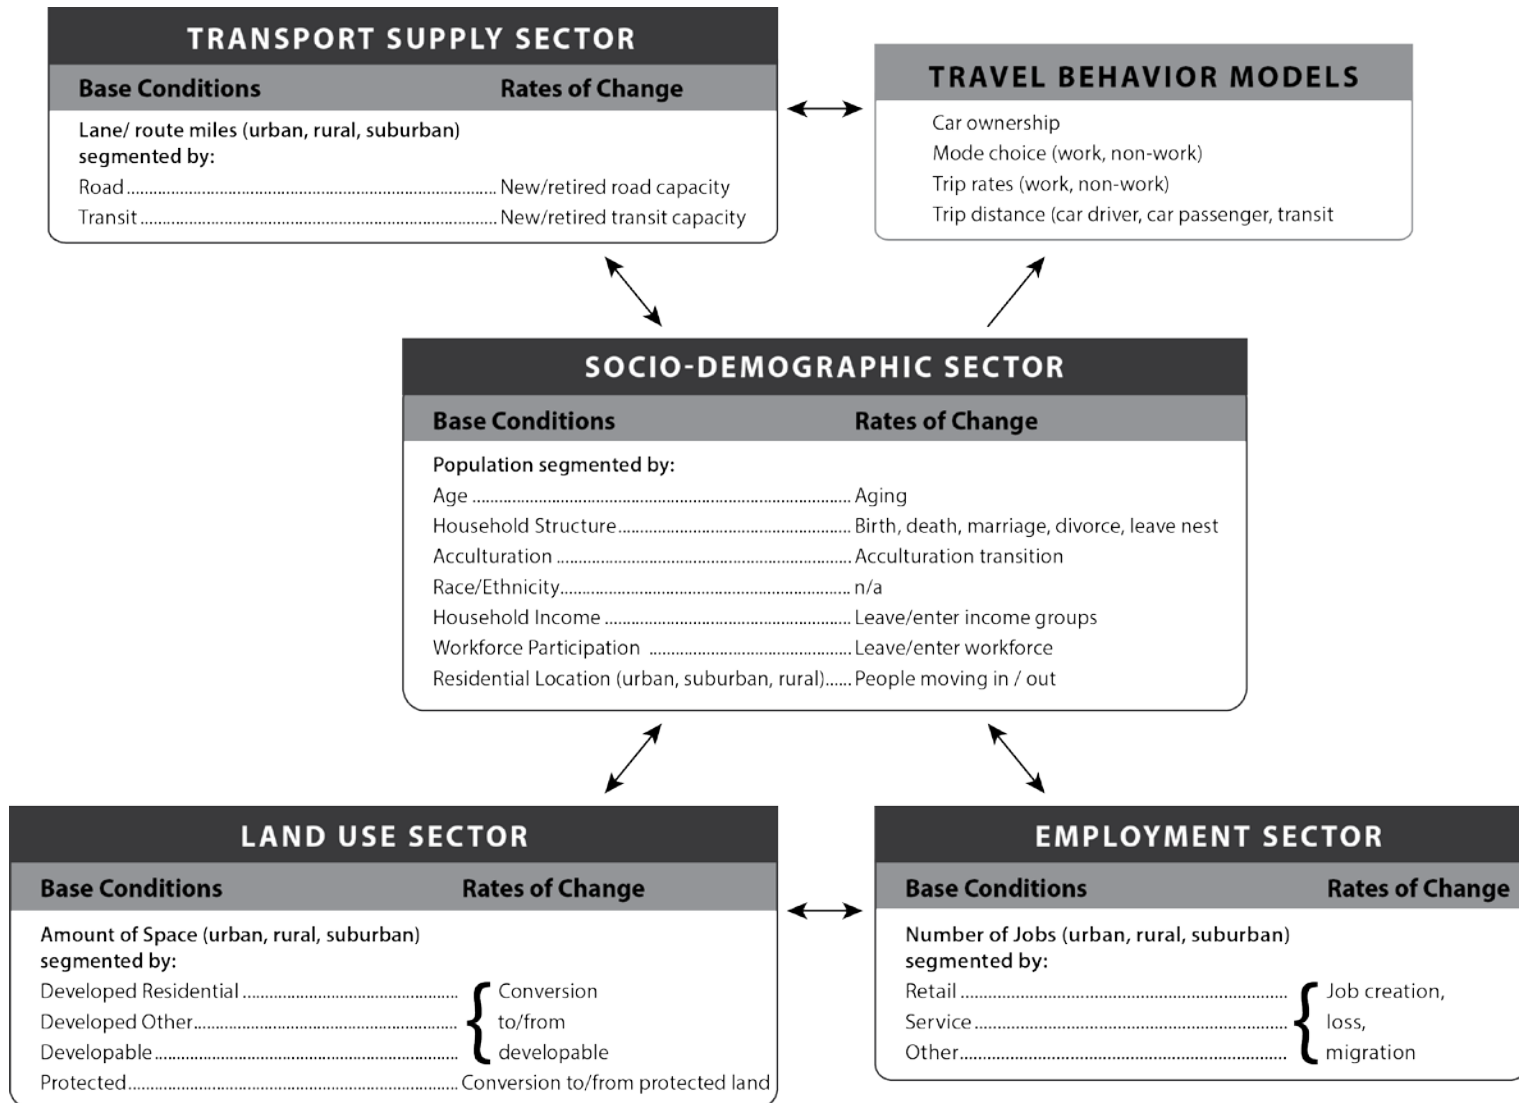

- “Limits to Growth” Club of Rome study (Meadows, *et al.* 1970's)
- Urban Dynamics (Forrester, 1970's)
- Many applications since in many different fields.

# System Dynamics Model

# Model Structure

# Demographic transition rates

- Basic rates derived from analysis of the Panel Survey on Income Dynamics (PSID) 2003-2009
- Rates for:
  - Birth
  - Death
  - “Marriage”
  - “Divorce”
  - Leave nest/empty nest
  - Enter/leave workforce
  - Enter/leave income group
- The user can apply scenario-specific multipliers on these rates

Rates vary by combination of:

- Age group
- Household type
- Race/acclturation

# Demographic migration rates

- Three types of migration:
  - Foreign (from / to other countries)
  - Domestic (from / to other regions of the US)
  - Regional (from / to other area types in the region)
- Base rates are derived from Census data, and modified by:
  - Residential attractiveness – function of demand vs. supply of jobs, housing, road capacity
  - User-defined scenario effects

## Other feedbacks...

- *The Employment Sector*
  - A very simple model of job creation, loss & migration
- *The Land Use Sector*
  - A very simple model of transition of land between residential, non-residential, undeveloped & protected
- *The Transportation Supply Sector*
  - A very simple model of capacity addition and retirement for roads and transit
- These feedbacks can be turned “on” or “off” to investigate the difference between unconstrained and constrained demand, and between responsive and unresponsive supply

# Options for Spatial Detail

- A single area for the entire region
- **Generic area types** (*urban, suburban, rural*)
- County-level zones
- Combination of County-level and area types
- Census tract level zones

MOR  
E  
DETA  
IL

Started with simple area types to ease data preparation and model useability.

Could move to somewhat more detail in a future version

Run Model

A How-to Guide

# Pre-Programmed Scenarios

*Based on Delphi panel deliberation*

- ***Momentum***
  - Change is based on population dynamics
- ***Technology Triumphs***
  - Innovations mitigate difficult challenges
- ***Gentle Footprint***
  - Public consciousness and political shifting toward taking serious action to curb climate change
- ***Global Chaos***
  - Distressing new normal – financial instability, climate change impacts, isolationism

# Structural diagram of the ICLV model (x=trip attributes; w=mode attributes; z=demographic characteristics)

# Why do we care about “latent attitudinal variables”?

- Because the NCRRP study specifically wants to know about “Intercity Passenger Rail in the Context of **Dynamic** Travel Markets”
- Policy makers want to understand changing demand as completely as possible
- They already have traditional demand estimates, but they want new methods to deal with changing attitudes and preferences

# Model applied to the survey data in an Excel interface for user-friendly scenario analysis

## Last Loaded Scenario: Mixed A

*Bad future for auto rejection, but good future for privacy tolerance. Information Communication Technology (ICT) need will continue with age. Refer to Chapter 6 of NCRRP Chapter 4 for a full description.*

[+] Demographics

[+] Time & Cost Indices

[+] Attitudinal Scenarios

[+] Results

### Getting Started

#### Getting Started

This dialog box will step you through your first scenario to get you started.

#### Step 1: Change from the Base Case

The "User" worksheet is where all user inputs are made and the results shown. To get started, click on the "+" to the left of "Demographics"

[+] Demographics

The Demographics user input area will expand. This is where you can change the demographics of future Business, Vacation, Visit, and Other travelers. On the right, you will find the Base Case, and on the left, you can make changes to the base case.

For our example, we will change the percentage of college graduates among business travelers to 80%. You will see that College Graduate is shaded white while "Not a college graduate" is shaded green. The green cells are the only ones that the user can change. So, in our example, type "20%" in the "Not a college graduate" cell, as shown below.

EDUCATION	Business	Vacation	Visit	Other
Not a college graduate	20.0%	33.9%	28.1%	35.8%
College graduate (calculated)	80.0%	66.1%	71.9%	64.2%
Total	100.0%	100.0%	100.0%	100.0%

You will see that the cell turns dark green, which indicates that it is different from the base case. If you want to revert it back to the base case, just click on the button "Reset to Base Case" on the right.

Now expand the Results section by clicking on the "+" next to "Results". This is where the change in mode share based on your inputs are shown.

You can make other changes to demographics, time and cost indices, and attitudinal factors by expanding and making changes in those sections.

#### Step 2: Scenario Management

You can manage your own scenarios within this workbook through the Scenario Management tools at the top of the "User" worksheet. To save the scenario we just created, click the SAVE button, as shown below.

Save Changes as New Scenario

SAVE

A new dialog box will appear where you can enter a name and description of the scenario.

## [-] Attitudinal Scenarios
