## Analysis of Freight Rail Rates for U.S. Shippers

## Methodology

For this study, Escalation Consultants examined Class I railroad rate data from the Surface
Transportation Board's (STB) Public Use Waybill sample for all major commodity groups shipped by rail. Data was analyzed for 2011, the most recent year available from STB, and for 2005. Escalation Consultants calculated the railroad's revenue-to-variable-cost ratio (RVC) for each shipment that originated or terminated in the U.S. RVC is an important indicator for freight rail rates because a rate greater than $180 \%$ RVC is subject to potential STB review for being unreasonably high.

For each group of related commodities, Escalation Consultants calculated the average rate for shipments below $180 \%$ RVC (those assumed to be competitive) and the average rate for shipments above $180 \%$ RVC (those potentially non-competitive and subject to STB jurisdiction). The difference between these average rates is presented as the shipper's rate 'premium.' Escalation Consultants further broke down the potentially non-competitive rates by RVC ranges (180-240\%, 240-300\% and above $300 \%$ ) to show the impact of the highest rates on the total premium. Data are reported for all commodities combined, as well as for major commodity groups (2-digit Standard Transportation Commodity Code (STCC)) and individual products (5-digit STCC) within each group for traffic originating in different geographic regions.

Further details on the methodology and the breakdown by geographic region are provided in the appendix.

## Key Findings

These findings are based on the Public Use Waybill sample provided by the railroads to the STB:

- In 2011, more than half (57 percent) of all rail rates exceeded $180 \%$ RVC, the threshold for a potential rate challenge before the STB.
- The average rate for carloads above $180 \%$ RVC was $\$ 1,335$ higher than the average rate for carloads below $180 \%$ RVC, meaning that shippers paid a $53 \%$ premium for these shipments.
- As a result, the total rate premium paid by commodity shippers in 2011 exceeded $\$ 16$ billion.
- The commodity groups with the largest total rate premiums were coal ( $\$ 5.2$ billion), chemicals and plastics (\$4.5 billion) and transportation equipment (\$1.2 billion).
- Many rates were far above the STB's jurisdictional threshold of 180\% RVC; for example, nearly one quarter ( 23 percent) of rates exceeded $300 \%$ RVC, or three times the railroad's variable cost.
- From 2005 to 2011, the total rate premium paid by commodity shippers increased $90 \%$ while the carload volume declined by 1.1\%

## Background: Current Landscape and Summary of Existing Rail Rate Data

American manufacturers rely on the nation's freight railroads to move many of their products to their customers. These materials and products serve as the foundation for the U.S. economy and ultimately wind up in grocery stores, car dealerships, power plants, and people's homes.

Since the last major freight railroad reform legislation more than 30 years ago, railroads consolidated from 26 major carriers to seven. With limited competition, freight rail rates increased more than 76 percent over the past decade - nearly three times the rate of inflation and three times as much as truck rates have increased.

Excessive rates can burden U.S. manufacturing and provide a competitive advantage to foreign producers. To better understand these impacts, Escalation Consultants conducted an analysis to quantify the premiums railroads charge U.S. manufacturers.

## Results from Analysis

The premiums for shippers in this study are broken out by each Standard Transportation Commodity Code (STCC) and by year (2005 and 2011). The study also explored how the volume of shipments changed between 2005 and 2011 to determine if greater demand led to an increase in the premium for shipments. Finally, the analysis also includes a detailed breakout of RVC ratios ( $180 \%-240 \%, 240 \%$ $300 \%$, and greater than $300 \%$ ).

The premium for movements with rates above a $180 \%$ RVC in this study also are broken out for each of the five rail territories in the U.S. Furthermore, detailed tables for major commodity groups as well as regional data are in the Appendix.

## RVC Ranges and Rate Premium for all Commodities (2011)

In 2011, more than half ( 57 percent) of all rail rates exceeded $180 \%$ RVC, with a total premium of more than $\$ 16$ billion. These rates are further broken out by RVC range. This breakdown shows that more
than one-third of all freight rail traffic has more than a $240 \%$ RVC while nearly one in four shipments has an RVC greater than $300 \%$. Most of the premium for rates above a $180 \%$ RVC is generated from movements with RVC's greater than $300 \%$ as they represent $\$ 10.2$ billion of the 16.2 billion premium for rates above a $180 \%$ RVC. Table 1 below shows the breakdown of all traffic with RVC's above $180 \%$ and the premium paid for these movements by RVC range.

| RVC Range | Percentage of <br> Total Carloads | Premium for Rates <br> Above 180\% RVC |
| :--- | :---: | ---: |
| $180-240$ | $22 \%$ | $\$ 2.9$ Billion |
| $241-299$ | $12 \%$ | $\$ 3.1$ Billion |
| $>300$ | $23 \%$ | $\$ 10.2$ Billion |
| Total above 180 | $57 \%$ | $\$ 16.2$ Billion |

## Commodity Groups with Highest Total Rate Premiums (2011)

The commodity groups with the largest total rate premiums were coal ( $\$ 5.2$ billion), chemicals and plastics ( $\$ 4.5$ billion) and transportation equipment ( $\$ 1.2$ billion). The average rate for carloads above $180 \%$ RVC was $\$ 1,335$ higher than the average rate for carloads below $180 \%$ RVC, meaning that shippers paid a $53 \%$ premium for these shipments. According to the analysis, the cost for non-competitive shipments can be up to 88 percent higher than a competitive shipment.

|  | \% Total <br> Carloads <br> Above 180\% <br> RVC | Premium <br> Per Carload | Premium as <br> Percentage above <br> Competitive Rate | Total Premium |  |
| :---: | :--- | ---: | ---: | ---: | ---: |
| 11 | Coal | $55.60 \%$ | $\$ 1,275$ | $69 \%$ | $\$ 5,202,315,266$ |
| 28 | Chemicals or Allied Products | $77.20 \%$ | $\$ 2,483$ | $88 \%$ | $\$ 4,485,035,101$ |
| 37 | Transportation Equipment | $37.20 \%$ | $\$ 1,967$ | $68 \%$ | $\$ 1,206,120,365$ |
| 20 | Food \& Kindred Products | $41.90 \%$ | $\$ 3,501$ | $41 \%$ | $\$ 763,493,718$ |
| 14 | Nonmetallic Minerals Except Fuels | $66.10 \%$ | $\$ 835$ | $56 \%$ | $\$ 750,281,347$ |
| 29 | Petroleum or Coal Products | $70.20 \%$ | $\$ 1,454$ | $51 \%$ | $\$ 659,335,776$ |
| 32 | Clay, Concrete, Glass or Stone Products | $74.60 \%$ | $\$ 1,731$ | $66 \%$ | $\$ 605,155,699$ |
| 33 | Primary Metal Products | $63.60 \%$ | $\$ 1,476$ | $41 \%$ | $\$ 596,971,008$ |
| 01 | Farm Products | $51.90 \%$ | $\$ 703$ | $22 \%$ | $\$ 558,722,461$ |
| 26 | Pulp, Paper or Allied Products | $42.60 \%$ | $\$ 2,007$ | $45 \%$ | $\$ 449,510,098$ |

## Percent Carloads by RVC Range (2011)

The study assessed the RVC ratios for major commodity groups. The table below provides percentage of carloads with RVCs between, 180-240\%, RVCs between 240-300\%, and RVCs above 300\%.

| STCC | Description | \% Total Carloads <br> Between 180\% RVC <br> and 240\% RVC | \% Total Carloads <br> Between 240\% <br> RVC and 300\% <br> RVC | \% Total <br> Carloads <br> Greater than <br> 300\% RVC |
| :---: | :--- | :---: | :---: | :---: |
| 1 | Farm Products | $32.90 \%$ | $11.60 \%$ | $7.40 \%$ |
| 10 | Metallic Ores | $50.00 \%$ | $13.50 \%$ | $8.40 \%$ |
| 11 | Coal | $15.10 \%$ | $9.80 \%$ | $30.60 \%$ |
| 13 | Crude Petro, Nat Gas \& Natural Gas | $19.10 \%$ | $6.80 \%$ | $12.10 \%$ |
| 14 | Nonmetallic Minerals Except Fuels | $27.40 \%$ | $18.40 \%$ | $20.30 \%$ |
| 19 | Ordnance \& Accessories | $13.50 \%$ | $14.10 \%$ | $62.80 \%$ |
| 20 | Food \& Kindred Products | $25.50 \%$ | $8.80 \%$ | $7.50 \%$ |
| 24 | Lumber or Wood Products | $21.80 \%$ | $9.10 \%$ | $6.20 \%$ |
| 26 | Pulp, Paper or Allied Products | $24.50 \%$ | $11.40 \%$ | $6.70 \%$ |
| 28 | Chemicals or Allied Products | $22.60 \%$ | $17.20 \%$ | $37.40 \%$ |
| 29 | Petroleum or Coal Products | $24.60 \%$ | $16.00 \%$ | $29.60 \%$ |
| 32 | Clay, Concrete, Glass or Stone Products | $28.70 \%$ | $19.70 \%$ | $26.20 \%$ |
| 33 | Primary Metal Products | $25.60 \%$ | $17.10 \%$ | $20.90 \%$ |
| 35 | Machinery Exc. Electrical | $12.10 \%$ | $11.20 \%$ | $71.60 \%$ |
| 37 | Transportation Equipment | $21.10 \%$ | $8.20 \%$ | $7.80 \%$ |
| 40 | Waste or Scrap Materials | $23.00 \%$ | $17.10 \%$ | $19.70 \%$ |
| 41 | Miscellaneous Freight Shipments | $14.90 \%$ | $10.30 \%$ | $30.50 \%$ |
| 48 | Waste Hazardous Materials or Waste Hazard | $21.90 \%$ | $11.10 \%$ | $39.90 \%$ |

## Change in Carloads and Premiums (2005-2011)

From 2005 to 2011, the total premium paid by commodity shippers increased $90 \%$ while the carload volume declined by $1.1 \%$. This suggests that increased demand is not the primary driver of a sharp increase in shipping premiums. Hazmat issues also do not appear to be a primary factor in driving rates higher. Coal, machinery, and nonmetallic minerals, and metallic ores were among the commodities that showed the sharpest discrepancy between the premium increase and the change in carloads.

Instead, the higher rate premium reflects a general shift towards higher RVC ratios. Despite a small decline in total carloads, the number of carloads with potentially non-competitive rates (RVC ratios above $180 \%$ ) jumped by 20 percent from 2005 to 2011. The number of carloads with very high rates
(RVCs exceeding 300\%) increased by 35 percent over this time period.

| STCC | Description | $2005$ <br> Carloads | $2011$ <br> Carloads | 2005 Premium | 2011 Premium | Carload Change | Premium Change |

## Conclusions

American manufacturers and their customers are experiencing a sharp rise in freight rail rates that is not driven by traditional free-market forces. While demand decreased from 2005-2011, the rate premium soared. Few commodities have been spared by skyrocketing freight rail rates. Both hazardous and nonhazardous shipments have experienced soaring freight rail rates. Only lumber and wood products experienced a sharp decline both in total rate premium and demand. Nearly one out of every four shipments today are shipped at rates exceeding $300 \%$ RVC or three times the variable cost of the shipment. In 2005, just one in every six shipments faced premiums that high. Increased demand and liability are clearly not driving freight rail rates. This unique business dynamic provides tremendous pricing power to a handful of freight railroads.

## Appendix

## Methodology for Calculating the Shipper's Rail Rate Premium

The 2011 Public Use Waybill Sample (Sample) was used to calculate the premium paid by shippers to railroads for moving their freight. The Sample represents $100 \%$ of all rail shipments that originate or terminate in the U.S. The Sample is a collection of railroad waybill records submitted by railroads to the Surface Transportation Board (STB); it is roughly a 3\% sample of all rail movements which is then expanded to represent $100 \%$ of all rail traffic. The 2011 Sample consists of 599,588 waybills. Escalation Consultants analyzed 248,596 Sample records, which included all commodity movements in the Sample except for Intermodal. The 248,596 Sample records, when expanded to represent all rail traffic for these types of movements, total to 19,461,517 carloads in 2011. When the 19,672,399 carloads analyzed in 2005 are added to the 2011 carloads a total of $39,132,676$ carloads were analyzed to determine the change in shippers' rail rate premium between 2005 and 2011.

Movement characteristics for each record were evaluated to determine the number of interchanges, car type, weight/car, rail territory of origin, destination and all relevant movement parameters so that railroad variable costs could be computed. All movements were run through the Optimized Rail Bid Evaluation (ORBE) batch processing program that can analyze the cost for hundreds of thousands of movements utilizing the STB costing program, the Uniform Rail Costing System (URCS). The ORBE calculated the following for each movement:

- Railroad long term variable cost; and,
- The Revenue to Variable Cost Ratio (RVC) (RVC= Revenue $\div$ Variable Cost).

The Staggers Rail Act of 1980 set a legislative demarcation for non-competitive rail rates as those rates with an RVC of $180 \%$ or greater. The $180 \%$ RVC level is referred to as the Jurisdictional Threshold, signifying the STB has no authority over tariff rates of less than $180 \%$, therefore. The ORBE established the non-competitive and competitive status by the RVC for each movement. In this Exhibit, noncompetitive movements are defined as those with an RVC of $180 \%$ or greater and competitive movements are defined as those with an RVC of less than 180\%.

The rate premium for commodities is determined by calculating the average difference between the rate per car above and below a $180 \%$ RVC for each commodity in each rail territory and then multiplying this rate difference by the number of cars with RVC's above a $180 \%$ RVC for that commodity and territory. The sum of the premium amounts for all territories represents the total rate premium for a commodity. A map showing the location of each rail territory is found on page 11.

The most detailed commodities in the Sample are five-digit Standard Transportation Commodity Codes (five-digit STCC's). For example, the Sample contains sixty (60) different five-digit chemical codes which represent all chemicals shipped by rail. The overall amount for chemicals (STCC 28 ) is the sum of the sixty (60) five-digit chemical codes.

In calculating the cost of non-competitive rates some commodities did not contain any movements with less than a $180 \%$ RVC in a rail territory and in other cases the makeup of moves with less than a $180 \%$ RVC was substantially different than the makeup of moves with RVC's greater than $180 \%$. In these instances competitive rail rates were computed based on the jurisdictional threshold of $180 \%$. In these situations competitive rates were determined by multiplying the railroad's average non-competitive cost per car for a commodity in a territory by $180 \%$. This is a conservative assumption as it assumes that the competitive rates for all movements in a territory are at the absolute highest possible competitive rate level which is $180 \%$ greater than the railroads' variable cost of non-competitive movements. The rate premium represents the difference between rates above and below a $180 \%$ RVC for a commodity in a territory so by establishing the competitive rate at the highest level possible the Study minimizes the rate premium when the competitive rate is a calculated amount.

A number of records in this sample were found to contain errors not detected or deemed significant by the STB. These types of moves were eliminated from the Analysis ${ }^{1}$.

Railroads are allowed to mask contract revenue either up or down in the Sample which means that rates may be over or understated to the extent that revenue masking occurs in the Sample. To the extent that revenue masking occurs it would apply to the rates for both non-competitive and competitive movements. The cost of non-competitive rates is calculated as the difference between average noncompetitive and competitive rates and both types of movements would be impacted by revenue masking so the cost of non-competitive rates should not be materially impacted by any masking of revenue in the Sample.

[^0]Gross track weight limitations are $286,000 \mathrm{lbs}$ or 143 tons. The tare weight or empty weight of typical railcars range between 26 and 55 tons, adding 130 tons of laden to an empty car will exceed the 143 ton limit. Shipping zero tons, or having a rate of \$zero or $\$ 30,000$ and above per car is deemed an input error; people do not ship commodities without weight, railroads do not tend to ship commodities for free and shippers do not tend to ship commodities at rates at or in excess of $\$ 30,000$ per car. An RVC level of less than $50 \%$ is indicative of an input error in the STB's Waybill regarding the rate or the distance per movement.

Waybill data in the Sample have been used by shippers, consultants, railroads and various federal and state governmental agencies in a wide array of cases before the ICC (now the STB), state regulatory bodies and the courts. The rate premium calculations in the Study utilized the Public Use Waybill Sample which contains the most detailed data the STB makes available to the public on rail movements.
