# REPORT OF COMMITTEE ON HIGHWAY FINANCE 

Chairman, Henry $R$ Trumbower<br>$U S$ Bureau of Publuc Roads, Washington, $D C$

The railroads and the highways may be sald to constitute the two chief means of transportation in this country, not taking into account the passenger movements in our large cities, where mass transportation is furnished in the main by electric street railway lines. Of all the land transportation systems the highway is the oldest and was the chief means of transportation until the end of the first third of the last century. After that tıme railroads were rapidly developed and extended so that up to the end of the century the railroad was considered the primary transportation agency in facilitating movements of goods and passengers.

With the advent of the motor vehicle the highway once more assumed its former importance in the country's transportation system At the present time there are 257,425 miles of railroad in the United States, with a total trackage of 409,359 mules The most authoritative information as to the number of miles of highway in the United States is that based upon the information gathered by the Bureau of Public Roads relative to highway conditions and expenditures for the year 1921. In that year it was reported that, for the United States as a whole, there were $2,941,294$ miles of all types of roads. This included the mantraveled highways with expensive surfacing and improvements, as well as the less frequently traveled roads leading from small rural settlements to the main and improved trunk highways This total mileage is supposed to include the legally lard out highways of the country. That part of this mileage which had been improved with some kind of surfacing amounted to 387,760 miles, or 132 per cent of the total mileage of the country The mileage of the so-called earth or dirt roads, without any surface improvements, was therefore $2,553,534$ miles, or 868 per cent of the total

The miles of road per square mile of land area in the United States amount to 099 miles In other words, there is not quite one mile of highway for every square mile of land area If the 387,760 mules of surfaced roads found in 1921 were equally distributed over the 48 states, that would amount to only $13 / 100$ of a mile for each square mile of land area, or be slightly more than 1 mule of surfaced road for every 8 square miles of land area

It is quite natural to find the smallest ratio between highway mileage and land area in those states where the population is the least dense. For example, Arizona has 0119 miles per square mile of land area On the other hand, Connecticut, which ranks the highest, has 2.52 miles of road per square mile of land area. Massachusetts has 234 miles, Indıana, 212 miles, Ohıo, 207 mıles; Rhode Island, 213 miles.

The highway mileage in any section of the country tends to vary, so far as its relationship to land is concerned, with the number of people living within that given area. The demand for roads does not come from land area or from the number of square miles that happen to be in any particular state The demand for a road comes because there are people who have need for its use, so that the road mileage depends upon the number of people living within a given area who have need for the transportation of their persons or goods from one place to another It is also noted, in studying the development of highways and their improvements, that the highest percentage of surfaced roads is found in those states where the population is the densest The need for surfaced roads is again a function of their use The more people living in a given area, the more use they make of the highway and the more necessary it becomes to improve the highway through surfacing in order to keep down the maintenance and repair costs

In a rather general way it may be said that the rallroads of the country are today of prime importance as freight carriers and that the highways are the great passenger carriers According to the report on the statistics of ralways in the United States for 1922, published by the Interstate Commerce Commission, the rallways of the United States carried in that year $35,469,961,582$ passengers one mile, the railroads produced that many passenger miles There is no authentic way of determining the exact number of passengers carried in the United States by motor vehicles Considerable information and data have, however, been gathered, which give us a farrly accurate basis for estimating the amount of traffic of this kind over our highways. The traffic counts and traffic surveys which have been made in a number of states show the average number of passengers transported in the passenger-carrying vehicles The Connecticut traffic survey showed that in that state there was an average of 25 persons per vehicle for all types of passenger cars Using this as a basis, it would appear to be a conservative estimate to assume that the passenger-carrying motor vehicles of the United States averaged at least two passengers per car On July 1, 1924, there were registered $13,645,000$ passenger cars in the United States If we assume that each one of these vehicles averaged 5,000 miles a year and carried on an average two passengers, we get a total passenger mileage of $136,450,000,000$ No definite data have been presented as to the division between the mileage traveled by the average passenger car over city streets and on rural roads It is believed that an assumption of 50 per cent as rural mileage is a very conservative estimate We can, therefore, say that at least $68,225,000,000$ passenger miles were produced by the motor vehicles on the rural roads This is still approximately twice the passenger mileage which the rallroads of the country produced in 1922

The average journey per passenger by rallroad compares very favorably with the average journey per passenger by motor vehicle In 1922 the average journey per passenger on the railroads of the country
amounted to 3666 mules The results of the Connecticut traffic survey show that passenger cars averaged 451 miles per car for each trip.

In comparing these two types of transportation, certain simılarities and differences are noted. The railroad transportation system of the country is wholly in private hands The roadbed and tracks and also the equipment are owned by organızations of private investors. When it comes to highway transportation, we find the situation quite different. The equipment, such as the motor vehicle, both passenger and motor truck, and storage houses and everything that pertains to the operation of the trucks is owned by individuals or by private organizations The roadbed itself is owned, constructed, and maintained by the public, except in a very few instances where toll roads and toll bridges still exist. In rallroad transportation the rate which one pays for transporting passengers or freight is intended to cover the costs relating to the operation of the equipment and to the maintenance of the roadbed and track and also the interest on the value of the property
In highway transportation we find that the same costs are present which prevail with reference to rallroad transportation The cost of the automobile or the motor truck and its operating costs have to be met, and also the cost of constructing and maintaining the highway has to be paid by someone Under the system which prevails at the present time the operator and owner of the motor vehicle bears its operating costs and the public, through state highway commissions or through local highway organizations, bears in the first place the costs of constructing and maintaining the highway. One of the main problems of highway finance is to apportion this highway cost among those who, on the one hand, make a direct use of the highway and benefit thereby, and among those members of the public, on the other hand, who are benefited indirectly through the development of our highway system. Leaving out of consideration the toll roads which used to be farrly numerous in bygone days where considerable highway traffic occurred, the public generally pard for the construction and maintenance of the highways and raised the funds necessary for this purpose from general property taxes or, in some cases, from assessments levied on land directly adjacent to, or close to, the improved highway. The advent of the automobile and the demand made through it for more extensive highway improvements, brought about a development of the policy that this type of user should stand a portion of the highway costs made necessary by him.

In the early days of the use of the automobile, the automobile was considered more or less as an incidental vehicle on the h'ghways The horse and wagon, which had been used for this purpose for ages, was still predominant At the present time the use of the horse and wagon, particularly as it applies to the transportation of passengers, has become almost obsolete, and even in the hauling of commodities over our highways, the motor truck is rapidly superseding the former type. This holds true chiefly for the main-traveled roads and for the trunk high-
ways. There are still a great many miles of our total highway mileage which can not be regarded as motor highways and which will always be farm-service roads.

In considering this phase of highway finance, it is of prime importance to know definitely the amount of funds devoted to highway expenditures which are directly contributed by the motor vehicle. The motor vehicle revenues of the country, aside from general property taxes, are raised mainly through two methods. One deals with the licensing of the motor vehicle and the exaction of a special fee in connection therewith; and the other method, which has recently come into vogue, is the taxation of gasoline which provides revenues proportionate to the use made of the streets and roads by motor vehicles. Through the use of these two methods the automobile is called upon to bear directly a part of the total cost of highway construction and maintenance.

## ratio of <br> TOTAL MOTOR VEHICLE LICENSE FEES AND GASOLINE TAXES

то
total rural highway expenditures exclusive of interest and principal payments

Figure 1.

## TOTAL MOTOR VEHICLE REVENUES COMPARED WITH TOTAL HIGHWAY EXPENDITURES

In Tables I, II, and III, and in Figure 1, are shown by states for the years 1921, 1922 and 1923, the total highway expenditures for those respective years and the total revenues derived from motor vehicle license fees and from the gasoline taxes and also the ratios which these total motor vehicle revenues bore to the total highway expenditures. The highway expenditures as tabulated here for the year 1921 cover the items of construction and maintenance of roads and bridges, administration and engineering, and the purchase and repair of machinery and

equipment and general and miscellaneous expenses. Payments made as interest and principal payments on highway bonds are excluded. For 1922 the total construction and maintenance items were obtained directly from state reports, and the item of purchase and repair of equipment and general and miscellaneous expense was estimated as bearing the same ratio to the construction and maintenance item as in the previous year. For 1923 no definite expenditure figures for the individual states are available The general information obtained as to the amount of expenditures indicated that the total 1923 expenditures were practically the same as the 1922 expenditures for the country as a whole, although there may have been variations for individual states which these estimates do not take into account The percentages show at least the trend of the ratio between motor vehicle revenues and highway expenditures. In Figure 1, the ratios which the motor vehicle revenues bear to the total highway expenditures for these thiee years are compared, the states being arranged in the order of the 1921 ratios

In 1921 the total highway expenditures of the country, exclusive of interest and principal payments, amounted to $\$ 946,021,826$, and the total license fees and gasoline taxes were $\$ 127,571,306$, which was 134 per cent of the total highway expenditures The total highway expendltures for 1922 were $\$ 931,886,835$, in that year the total motor vehicle revenues amounted to $\$ 160,854,384$, or 172 per cent of the highway expenditures Using the same expenditure figures for 1923 as for 1922, we find that the total motor vehicle revenues of $\$ 225,426,978$ amounted to 242 per cent of the amount of money spent for highway construction and maintenance In 1924 it is believed that the total motor vehicle revenues from license fees and gasolne taxes will approximate $\$ 300$,000,000 , which will be about one-third of the total highway expenditures, assuming that the 1924 expenditures will not be greatly different from those of preceding years

During this four-year period the motor vehicle revenues have increased about 144 per cent, but the motor vehicle registration increased only 50 per cent This increase in the total motor vehicle revenues is due, in addition to the larger number of cars registered, to the raising of the license fees on passenger cars and the further increased fees on motor trucks, and to the added revenues produced by the gasoline tax

In 1923 there were five states-Massachusetts, Vermont, Connecticut, Maryland, and Rhode Island-in which the motor vehicle revenues were more than 50 per cent of the total h ghway expenditures for that year, in Massachusetts they amounted to 645 per cent In 1922 Massachusetts was the only state in which the ratio was over 50 per cent The five states which raised the smallest amount of the highway expenditures from motor vehicle revenues in 1923 were Arizona, Mississippi, New Mexico, Texas and Wisconsin, in which states the ratio between motor vehicle revenues and highway expenditures was less than 12 per cent It is observed that in 1923 there were 26 states in which motor vehicle
revenues were less than 25 per cent of the total highway expenditures, and 22 in which they were greater. In 1921 there were only 6 statesConnecticut, Maryland, Massachusetts, Nebraska, Rhode Island, and Vermont-in which the motor vehicle revenues equaled or exceeded 25 per cent of the highway expenditures. The trend during this three-year period is readily seen.
aVERAGE REVENUE PER MOTOR VEHICLE I92I AND 1923

Figure 2.

## COMPARISON OF AVERAGE MOTOR VEHICLE REVENUES PER VEHICLE DERIVED FROM LICENSE FEES AND FROM GASOLINE TAXES, 1921 AND 1923

The relationship between motor vehicle revenues and highway expenditures having been established, it now remains to be seen in what manner the motor vehicle revenues are raised. In Tables IV and V, and in Figure 2, there were shown for the years 1921 and 1923, respectively, the average motor vehicle revenues per vehicle and the division of these revenues between license fees and gasoline taxes. In 1921 the fees for licenses and permits collected by the several states amounted to $\$ 122,269,071$, covering a total registration of $10,422,670$ motor vehicles; this resulted in an average payment of $\$ 11.70$ per vehicle. In that year 13 states collected $\$ 5,302,259$ in gasoline taxes, which amounted to an average of 50 cents per motor vehicle for the country as a whole, or $\$ 2.74$ per motor vehicle for those states in which the gasoline tax was in effect. If we divide the sum of all the license fees and the gasoline taxes by the total number of motor vehicles, we get an average of $\$ 12.20$ paid by each vehicle. For those states which had the gasoline tax, the average motor vehicle revenues were $\$ 14.40$ per vehicle. The highest average payment

| Ave all States | 1496 | 1252 | 84 | 244 | 16 |

[^1]per motor vehicle was found $n$ Oregon, where an average payment of $\$ 2760$ was divided on the basis of 71 per cent license fees and 29 per cent gasolne taxes Kansas collected the lowest average revenue, or $\$ 4.85$ per vehicle, which was wholly in license fees In that year the average motor vehicle revenues exceeded $\$ 20$ in but three states-New Hampshire, New Mexico, and Oregon, in 34 states the average revenues were between $\$ 10$ and $\$ 19$, and in 11 states they were less than $\$ 10$

In 1923, the last year for which full and complete data are available, the total license fees and, permits amounted to $\$ 188,970,992$ for a registration of $15,092,177$ motor vehicles, or an average of $\$ 1252$ per vehicle A gasoline tax was collected in 35 states, yrelding a total of $\$ 36,813,939$, which resulted in an average payment of $\$ 432$, for those states in which the tax was in effect If the gasoline tax revenues are applied to the total registration of the country, the average payment per vehicle is reduced to $\$ 244$ The total motor vehicle revenues of all the states represented an average of $\$ 1496$ per vehicle, if the 35 states which had in effect a gasoline tax are segregated, the motor vehicle revenues in those states averaged $\$ 1687$ per vehicle In this year there were 15 states in which the motor vehicle revenues averaged $\$ 20$ and over per vehicle, in 28 states the average ranged between $\$ 10$ and $\$ 19$; and in 5 states the average was still less than $\$ 10$ per vehicle.

The average motor vehicle revenues for 1921 and 1923 can be compared thus

|  | 1921 | 1923 |
| :--- | ---: | ---: |
| Average Revenues $\$ 20$ and over | 3 States | 20 States |
| Average Revenues $\$ 10$ to $\$ 19$ | 34 States | 28 States |
| Average Revenues $\$ 10$ and less | 11 States | 5 States |

For those states which had in effect a gasoline tax in 1923, California's gasolne tax receipts were only 9 per cent of the total motor vehicle revenues, and in Arizona and South Carolina they constituted 63 per cent of the total motor vehicle revenues It should be stated that the gasoline tax had not been in effect in Califorma during the whole year In South Carolina is found the highest amount collected as gasoline taxes per vehicle, namely, $\$ 1186$, which was 63 per cent of the total collectıons, Oregon collected $\$ 1180 \mathrm{in}$ gasoline taxes from each motor vehicle owner, but this amounted to only 33 per cent of the total motor vehicle revenues This smaller percentage is due to the higher license fees in effect. In Oregon, as well as in a number of other states, the motor vehicle is not subject to the general property tax There were only five states in which the average amount collected as gasolne taxes exceeded $\$ 10$ per vehicle.

## GASOLINE TAX RATES IN EFFECT JULY 1, 1924

A map of the United States, referred to as Figure 3, indicates the states which are charging a gasoline tax and the rates in effect. One state is charging a 4 -cent tax; nine charge a 3 -cent tax, two charge a $21 / 2$-cent tax, fifteen charge a 2 -cent tax, and elght charge a 1 -cent tax There has been a tendency for states to start with the lower rate and later to increase it Of the fifteen states which are now charging a

Figure 3
Gasolne Tax Rates in Effect July 1, 1924
2-cent tax, seven began with a 1-cent tax Oklahoma, which now charges $21 / 2$ cents, had at first a 1-cent tax Six of the states with a 3 -cent tax began by collecting a 1 -cent tax, and two of the states in the 3-cent group began with a 2-cent tax Arkansas, which now has a 4 -cent tax, began with a 1 -cent rate

## GASOUNE TAX REVENUES PER CAR <br> GASOLNE CONSUMPTION PER CAR FIRST SIX MONTHS 1924

GASOLINE CONSUMPTION AND TAX RECEIPTS PER CAR FOR SIX MONTHS PERIOD-JANUARY 1, 1924 TO JULY 1, 1924
The gasolne tax collections amounted to $\$ 4.18$ per car for those states which collected this tax for the first six months of 1924 (Table VI, Figure 4) The average consumption per car was 2115 gallons It is estimated that the year's consumption will average more than twice this amount as there will be more automobile operation in the last

TABLE VI
gasoline consumption and gasoline Tax revenues per car

| Wyoming | 201 | 201 |
| Average | 2115 | \$4 18 |

half of the year than in the first half because of road and weather conditions So far as can be ascertained, the increasing of the gasoline tax rates has had no retarding effect on gasoline sales and consumption per car. An exact comparison in the amount consumed per car per unit of time can not be made for all states because of the rate changes taking place at odd times or because of some irregularity in reporting. Florida and Georgia were both charging a 1-cent rate during the first six months of 1923, the average consumption of gasoline per car was 318 gallons for that period in Florida and 373 gallons for the first six months in 1924, when the rate was increased to 3 cents, likewise, there was an increase from 266 gallons per car to 310 in Georgia for those same periods when the tax rate was changed from 1 cent to 3 cents In Pennsylvania, South Dakota, and Washington the gasoline tax for the first six months of 1923 was 1 cent, and for the first six months of 1924 it was 2 cents The average consumption per car for these same periods increased from 155 gallons to 162 gallons in Pennsylvanıa, from 136 gallons to 187 gallons in South Dakota, and from 178 gallons to 243 gallons in Washington.
gasoline consumption per car under various gas tax rates

In Figure 5 is shown a comparison of the gasoline consumption per car under various gasolne tax rates The first six months of 1923 and the first six months of 1924 are compared in five states where the gasoline tax rate was advanced from 1 cent per gallon to 2 cents in three of the states, and to 3 cents in two of the states In every case it is
shown that the consumption of gasoline and the averrage use of the cars increased irrespective of the advance in the tax The price of gasoline is an element which should also be considered, but average retail prices of gasoline were not avalable when these comparisons were made.

## average passenger car License fees COMPARED WITH AVERAGE MOTOR TRUCK FEES FOR 28 STATES, FIRST SIX MONTHS 1924

鹳This comparison could be made for only 28 states which reported separately the license fees derived from passenger cars and from motor trucks, as well as the separate registrations The average passenger license fee ranged from $\$ 317$ in Californa to $\$ 2820$ in Idaho (Table VII, Figure 6). The average for these states was $\$ 1070$, though it should be noted that in 17 of the states the average fees were larger than the_average license fee for the 28 states as a whole

Figure 6
The average motor truck license fee for these same states was $\$ 2190$, or over twice as much as the average passenger car fee The lowest average is found in Montana, where the average motor truck was charged only $\$ 11.60$ for a license, and the highest is in Oregon, where the average was $\$ 5180$ In this case the average was also the mean; 14 of the states charged a license fee greater than the average, and 14 charged less There is a marked tendency to charge higher license fees for motor trucks than for passenger cars even in those states where the average passenger car license fees are low In those 11 states where the passenger car license fees are less than the average, or less than
$\$ 1070$, the motor truck license fees are on the average 143 per cent higher, for those 18 states where the average passenger car license fees are above $\$ 10.70$, the average motor truck fees are only 59 per cent higher.

TABLE VII

AMOUNT OF MOTOR VEHICLE FEES AND GASOLINE TAX RECEIPTS APPLICABLE TO HIGHWAY WORK BY OR UNDER SUPERVISION OF STATE HIGHWAY COMMISSIONS, 1923
In Tables VIII and IX, Figures 7 and 8, are shown the gross motor vehicle license fees and gasolne tax receipts and the amounts which the several states devote to highway work under the direction of state highway commissions, the tabulations cover the year 1923. Of the $\$ 188,613,054$ collected as motor vehicle license fees, $\$ 153,226,618$, or 81

Figure 7.
per cent, was used for highway work by the state highway departments. In 14 of the states 100 per cent of the license fees are turned over to the state highway departments; in 17 states the state highway commissions

direct the expenditure of 90 to 99 per cent of the motor vehicle license fees, in 10 states, between 50 and 89 per cent, and in 7 states the amount of motor vehicle license fees applicable to highway work or under supervision of state highway departments is between 10 and 49 per cent of the total collected in this manner.

The gasoline tax recerpts for 1923 were $\$ 36,813,924$; of this amount state highway departments directed the expenditure of $\$ 21,528,542$, or only 58 per cent. In 13 states the state highway commissions control the expenditure of all the gasoline tax recenpts, in 5 states they control 90 to 99 per cent, in 6 states, 50 to 89 per cent, and in 8 they control less than 15 per cent In 2 states, Alabama and North Dakota, the state highway commissions do not recerve any part of the gasoline tax recelpts, nor do they have any supervision of their expenditures.

Those revenues derived from the license fees and the gasolne tax, which are not turned over to state highway departments, are usually divided among the counties or are credited to the general fund, from which they are again appropriated for highway work or for the payment of interest and the retirement of highway bonds In only a few cases are the motor vehicle revenues diverted to uses wholly foreign to road work.

HIGHWAY EXPENDTTURES PER CAPTTA, ISZ (EXCLUSNE OF INTEREST AND PRINCIPAL PAYMENTS) amp ratio of per capita highway expenditures to per capita income

Figure 9

## RELATION OF HIGHWAY EXPENDITURES TO INCOME

In discussing the subject of highway expenditures the question is often raised as to the amount of money which the people of a state or a community can afford to spend for the improvement of the roads. The relationship which exists between the highway expenditures and the income of the people reduced to a per capita basis furnishes one criterion which can be applied The data used in determining this are for 1921, in which year an all-inclusive survey of highway expenditures was made by the Bureau of Public Roads, and the latest estimates of the per capita income of the United States are also for that year.

In Table X, Figure 9, are set forth by states the per capita highway expenditures exclusive of interest and principal payments, and the

| Average | \$9 00 | 113 |

percentages which these highway expenditures bear to the per capita incomes of the several states In 13 of the states-Alabama, California, Connecticut, Illinoıs, Maryland, Massachusetts, Missourı, New Hampshre, New Jersey, New York, Pennsylvania, Rhode Island, Vermontthe per capita highway expenditures in 1921 amounted to less than 1 per cent of each person's income, in 17 of the states-Colorado, Florida, Georgıa, Kentucky, Louısıana, Maıne, Michıgan, Nebràska, New Mexıco, Ohıo, Oklahoma, Tennessee, Texas, Utah, Vırgınıa, Washıngton, West Virginia-the highway expenditures were between 1 and 2 per cent of the income, in 11 of the states-Delaware, Indiana, Kansas, Minnesota, Montana, Nevada, North Carolina, North Dakota, South Carolina, Wisconsin, Wyoming-the highway expenditures were between 2 and 3 per cent, and in 7 states-Arizona, Arkansas, Idaho, Iowa, Mississippi, Oregon, South Dakota-they were over 3 per cent In South Dakota the highest ratio was found, the highway expenditures amounting to 684 per cent of the people's income, in New York the lowest ratio was found, the highway expenditures being only 34 per cent of the income. In general, it may be said that where the per capita highway expenditures are large, there the ratio between such expenditures and the people's income tends to be high. In states where there are large cities, the per capita expenditures tend to be less and at the same time the per capita income is larger than in the states where the rural populations dominate In the New England and Middle Atlantic States, the per capita expenditures for highway work averaged 55 per cent of the per capita income in those states, in all of the other sections of the country they were over 1 per cent, and in the West North Central and the Mountain States they were over 2 per cent. These higher percentages are accounted for by small populations bearing the costs of extended highway improvements with relatively small incomes per capita

## RECOMMENDATIONS CONCERNING FURTHER INVESTIGATIONS IN THE FIELD OF MOTOR VEHICLE TAXES FOR HIGHWAY PURPOSES

Up to the present time, the data which have been gathered relative to the whole subject of motor vehicle taxation are confined solely to the revenues obtained through hicense and registration fees and through the introduction of the gasoline tax In a great many states the motor vehicle owner has to pay additional taxes levied on his car. In the first place, the motor vehicle is, in most states, subject to the personal property tax the same as any other kind of property is, except in cases where state legislatures have provided specific exemption for the automobile from this kind of tax. So far as can be learned, there are now 13 states which do not levy a property tax on the motor vehicle-Delaware, Idaho, Iowa, Michigan, Mınnesota, New Hampshıre, New York, North Dakota, Oklahoma, Oregon, Pennsylvanıa, Tennessee, and Vermont In these states the license fees are collected in heu of property taxes. No definite figures have as yet been ascertained as to the amount of the
general property taxes on automobnles for the country as a whole. 'I'he estimates which have been made show wide variations. It is frequently stated that even those states which tax the motor vehicle as property fall to a very considerable extent in collecting the taxes from all of the car owners In many instances, there does not appear to be any close relationship between the state motor vehicle registration office and the taxation authorities The hope of remedying this condition was the reason given for a number of states to increase the hcense fees and exempt the automoble from the general property tax To be able to show fully the extent to which the motorists contribute toward highway expenditures, it is necessary to make further inquiries into this subject of the taxation of the motor vehicle as property.

In the second place, motorists in many cities are obliged to pay special municipal license fees, sometimes known as "wheelage taxes" In some cases they amount to more than the state license fees It is therefore of importance to collect data as to the amount of revenues derived from the automobile in this manner and the use to which such funds are put.

Further investigations should also be made with reference to the distribution of license fees and gasoline taxes as between state highway authorities and local governmental units There is already an indication that municipalities in some instances claim a share of the gasoline taxes. In order to work out some fundamental principles regarding the allocation of such revenues, it is necessary to determine more fully than has yet been done the relative use which city-owned motor vehicles make of our rural highways as compared with the use made by rural cars, and further data should be collected that will show the proportion of the total motor vehicle mileage which occurs within city limits as compared with the rural highway mileage Such facts will be of use in the development of apportionment principles.

The effect which improved and hard-surfaced roads have on values of adjacent farm lands constitutes a problem of special interest to one studying this subject of the equitable apportionment of the highway finance burden There are now under way several research investigations inaugurated by the Bureau of Public Roads in cooperation with state bodies, which it is expected will give us certain fundamental data that will be of value in determining to what degree real property in the rural sections should contribute towards highway improvements

There is no doubt that many of the state legislatures will find it necessary in the next few years to revise and expand their highway laws and to provide more adequately for contemplated highway improvements In order that such legislative work may be done according to sound economic principles and in harmony with good public policy, it behooves those interested in these subjects to procure and interpret all the underlying facts of highway finance so that they shall be available to all who seek guidance and knowledge therefrom.

In discussing the report of the Committee on Finance, R. C. Marshall, of the Associated General Contractors of America, presented another
phase of highway finance-the necessity of scientific business research.
In his discussion the speaker said, "In years that have passed, I have heard statements made by responsible officials, of the low cost they were getting for the construction of their highways. Generally speaking, the low cost was decidedly uneconomical because these highways do not exist today."

An Analysis of Defaulted Hıghway Contracts by Frank Page, North Carolina State Highway Commission, was the next paper on the program. Mr. Page outlined the reasons for 34 defaulted projects in North Carolina and stated that a chief element contributing to the defaulting was the ease with which contractors could secure contract bonds. Mr Page's paper was printed in full in several magazines, one of them being the February issue of the Highway Builder.

T J Wasser of the Public Service Production Co , Newark, N. J., and H G Shirley of the Vırgınıa State Hıghway Commıssion contributed an interesting discussion of Mr Page's paper. Both speakers presented facts that indicate a necessity for definite action in order to prevent future defaulting of contracts
