In considering the foregoing it should be noted that in the test runs the conditions, such as algnment of wheels and tires, were for the most part carefully controlled. Full standard inflation was used. The speed of twenty-five mules per hour is now probably too low to be considered as average The tires were probably above average in quality and received more than ordinary care. None but dry pavements were used. Considering all such conditions it seems certain that the above figures are conservative

Laboratory investigations are in progress to collect data upon the effect of inflation, temperature, moisture and tread rubber quality upon tiead wear While progress has been made in all these phases of the investigation it is not now possible to state even preliminary conclusions

Investigations to be undertaken include the effect of speed, size and weight of vehicle upon tread wear, also roughness of road surface. The question of the relative wear of low, medium or high grade tires as affecting tire economy is an important one Statistics are needed showmg the numbers of tires used in various size and quality groups.

## C

# INVESTIGATION OF TIRE WEAR 

H J Dana<br>State College of Washington, Pullman, Washington

The Engineeing Experiment Station of the State College of Washington has been conducting a series of measurements of tread rubber loss from automobile tires that were operated on some of the standard roads in the vicinity of Pullman, Washington Four dufferent cars and four sets of tires were used so it is not possible to compare runs made with one car with those made with another The following preliminary report of the results is not considered to be conclusive, but is indicative of the general trend and should be evaluated on that basis.

TIRE TEST HIGHWAYS

| Location of Hıghway | Kind of surface | Length of test road | Distance run | Remarks |
| :---: | :---: | :---: | :---: | :---: |
| Pullman to Palouse | Macadam | $\begin{gathered} \text { Miles } \\ 16 \end{gathered}$ | $\begin{gathered} \text { Miles } \\ 65 \end{gathered}$ | Crushed basalt, some corrugations, loose material on surface, $3 / 4$ mule; roads with grades 46 per cent to 5 per cent, level for most part Two round trips constitute a "run" Road about 30 feet wide, some curves, dirt shoulders No rains during tests Frequently planed by manntenance crew |
| Pullman to Lewiston | Macadam | 35 | 70 | Crushed basalt, some rough places, and loose material Easy curves and grades, dirt shoulders, loose gravel at edges of road Lewnston Hill 8 miles long and average of less than 5 per cent grade Several harrpin curves on steep grade Test down hill, up hill, and on level hughway 20 MPH Took all day for one test Temperature variation 10 to 15 degrees during day |
| Dishman to Coeur d'Alene | Concrete | 36 | 150 | Concrete in very good condition, in some places worn smooth, olly from oll dropped by passing cars No grades to mention, easy curves Two round trips per test |
| Dishman South | Macadam | 10 | 80 | Crushed basalt, meduum size, some loose gravel on surface, easy curves, some easy grades Very little washboard, dusty, smoother worn track in middle Forest along part of route Several rall crossings |
| Portland to Gresham. | Bithulithic | 22 | 17 | Columbia Rıver Highway, blacktop in good condition Some oll on surface, several easy curves, easy grades Road crowned a reasonable amount Turnout seldom requres travel on dirt or gravel shoulders Forest along part of route Test run both ways |

TIRE TEST HIGHWAYS-Continued

| Location of <br> Highway | Kind of <br> surface | Length <br> of test <br> road | Dis- <br> tance <br> run |  |
| :--- | :---: | :---: | :---: | :---: |
| Little Rock to <br> Centralia and <br> to Elma | Gravel | 67 | 67 | Water worn gravel mixed with sand <br> and clay forming reasonably fine <br> roadway with rounded gravel <br> protruding from surface <br> run one way |
| Test |  |  |  |  |
| Vanmpia to <br> Vancouver | Concrete | 120 | 120 | Concrete with average level grade <br> Some easy curves and grades, <br> dirt and gravel shoulders Con- <br> crete in good condition Forest <br> along part of route All in good <br> repair One test going up, second <br> test returning |

TIRE DATA AT START OF TESTS

| Car | Size and location of tire | Air pressure | Age of tıre | Remarks |
| :---: | :---: | :---: | :---: | :---: |

D

## INVESTIGATION OF GASOLINE AND OIL CONSUMPTION

Mark L Ireland<br>Major, Quartermaster Corps, U S Army

In evaluating the relation between type of road surface and the cost of vehicle operation, the first factor to consider is the relative fuel consumption. The following tabulation represents an accumulation of data obtained in connection with the ordinary activities of the Quartermaster Corps, U. S. Army. It is presented herewith so that it will be generally available for reference.
