

Energy Solutions

August 19, 2009

With oil supplies and oil prices influenced by geopolitics and expected by some to peak by mid-century, there is a need to fundamentally examine the way energy is produced, stored, distributed, and used. This session examines this multifaceted problem and provides a glimpse of potentially promising approaches to achieve a sustainable, secure, and environmentally friendly energy future. Panelists will discuss recent advances in renewable energy technologies and market incentives for higher efficiency and "greener" fuels.

Presenters for this session include:

Robert Rosner, University of Chicago

Dan Bilello, National Renewable Energy Laboratory

John B. Heywood, Massachusetts Institute of Technology

Steven Edward Plotkin, Argonne National Laboratory

This webinar is co-sponsored by the Transportation Research Board and the American Association of State Highway and Transportation Officials.
