# What is Magnelis®

## Product Description:

- Hot dip Zinc metallic coating with 3.5% Aluminium, & 3% Magnesium
- With improved corrosion performance (sacrificial & barrier) vs. pure zinc (sacrificial only)
- Coating designation is “ZM”

**Has a natural dark grey, spangle-free smooth aesthetic surface**

# How are ZnAlMg Coatings Produced

## Continuous Hot Dipped Metallic Coating Process

### Key Benefits:

- Continuous automated process
- Online control, uniform coating
- Metallic coating layer of Zn, Al, Mg alloys
- Coating Weight expressed in  $\text{g/m}^2$  (combined both sides)

# Hot Dip Metallic Coatings Comparison ZM vs. GI (Galvanize)

Hot dip metallic coatings morphology (not to scale or equivalent coating thickness)

# Why do we Like It

## Unique Properties Magnelis<sup>®</sup> (ZM) vs. Hot Dip Galvanize (GI)

- Superior corrosion protection (sacrificial & barrier) even in aggressive environments (chloride, ammonia, alkaline, soils, wet concrete)
- Less coating mass required (2 to 3 times) while achieving equivalent/better corrosion performance than GI
- Environmentally friendly (less Zinc runoff & usage).
- Improved cut-edge protection/self healing
- Low coefficient of friction & powdering results in excellent roll forming, bending, punching, & less Zinc tool buildup
- Similar weldability to GI
- Alternative to heavy coating post dip/batch Galvanize and other metals

ZM performance better or equivalent to GI

# Corrosion Mechanisms

## Improved Corrosion Resistance: Barrier Oxides

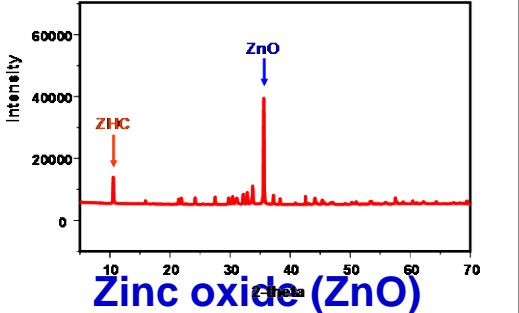

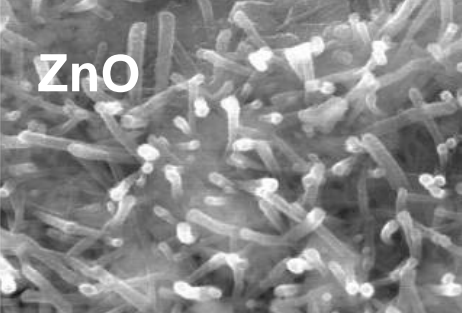

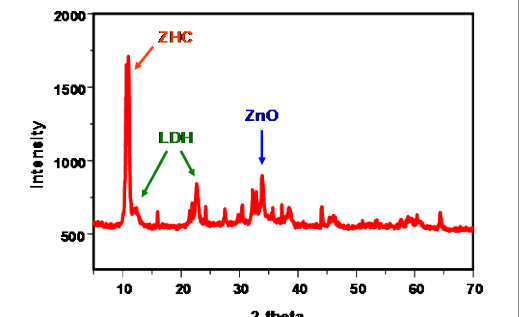

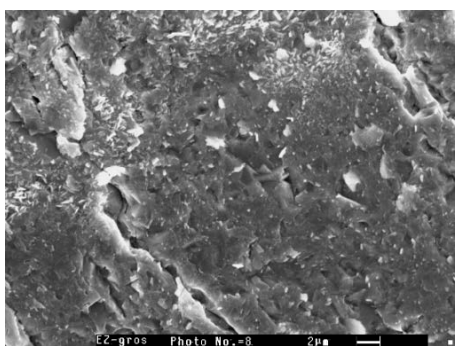

- ➔ When the metallic coating (M) corrodes, the corrosion resistance is closely linked to the inhibiting (barrier) properties of corrosion products that precipitate both on steel and coating surfaces
- ➔ The more compact and stable the corrosion product layer is, the greater the limiting effect on oxygen reduction resulting in a slower corrosion rate
- ➔ For ZM coatings, alloying elements (Al & Mg) contribute to the precipitation of compact and stable corrosion products which strongly inhibits oxygen flow
- ➔ 3% Mg in the coating insures a stable barrier effect\*

\* study at Tsukuba University / Japan- March 2010

# ZM & GI Corrosion Mechanisms

Corrosion products formed during accelerated corrosion testing

Coating	Main corrosion products	Structure	Characteristic
GI coating (10µm)	 <p>Zinc oxide (ZnO)</p>	 <p>ZnO</p>	<p><b>Porous corrosion products</b></p> <p><b>Low inhibition</b></p>
ZM coating (10µm)	 <p>Simonkolleite (ZHC) and AlMg basic salt (LDH)</p>	 <p>ZHC / AlMg LDH</p>	<p><b>Compact corrosion products</b></p> <p><b>High inhibition</b></p>

➔ ZM product with 3.5% Al & 3% Mg is an ideal coating composition which results in compact corrosion products and exceptional corrosion performance

# Corrosion Performance – Self Healing

## Cut edge protection

### Self Healing Mechanism

The exposed cut end of substrate is oxidised

Subjected to rain and condensation

The zinc-based film containing magnesium on the coating layer migrates over the cut end.

Disappearing of red rust and increasing of white rust

Initial exposure period (up to several weeks)

Intermediate exposure period (beyond several weeks)

Long exposure period (after more than a year)

White rust

Coating layer  
Red rust

# Corrosion Performance – Self Healing

## Cut edge protection

6 months  
30-40% red rust - 60% white rust

16 months  
10% red rust - 70% white rust

## Self-healing cut edge affect

Outdoor exposure over different time periods of Magnelis® ZM250 with 2 mm thickness in Brest (France) Marine category C5-M (the most severe) Institut Français de la Corrosion

# Corrosion Performance

## Corrosion Resistance: *Salt Spray Test*

ZM250 (20 $\mu$ ) compared with Z275 (G90) pre galvanized (20 $\mu$ )

Salt Spray test

GI after 6 weeks      ZM after 34 weeks

ZM250 (20 $\mu$ ) compared with Z1170 (G380) post/batch galvanized (85 $\mu$ )

Salt spray test 2000 hours

Post-galvanised 85  $\mu$ m coating

Magnelis® ZM250/20  $\mu$ m coating

ZM (Magnelis®) outperforms standard continuous and batch galvanized (GI) materials

# Corrosion Performance

## Corrosion Resistance: *Marine/Chloride Environment*

← Sea

← Samples

Test Area: Brest, C5M environment  
(marine, 2 meters from the sea)

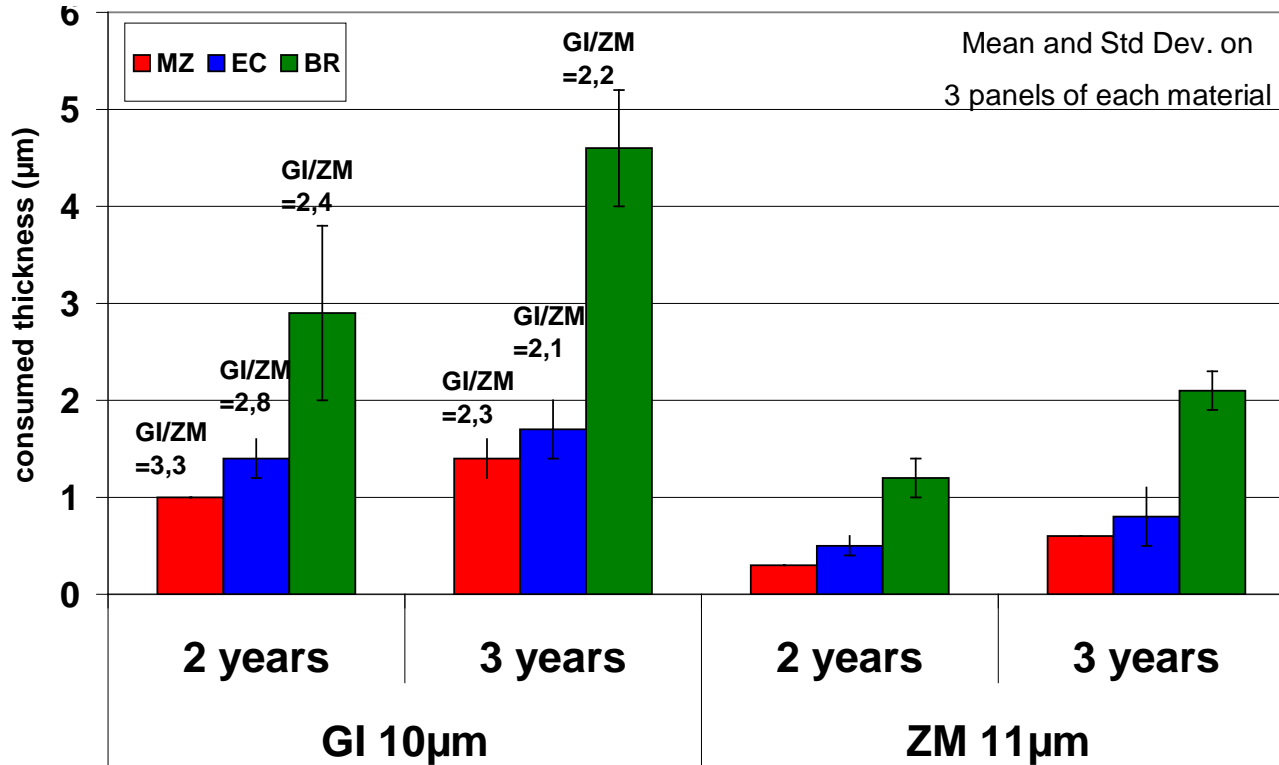

Similar test done in Daytona Beach (C4/C5 environment) with even better results

In Marine/Chloride environments Galvanized (GI) steel corrodes 3 times faster than Magnelis® (ZM)

# Corrosion Performance

## GI (Z) & ZM Mass Loss after 2 & 3 Years – Outdoor Sites:

- Magnelis® (ZM) appears to be the best coating in all environments - mass loss ~2-3 times less than GI
- With chlorides - marine site Brest, France (BR) or without chlorides - rural Maizières, France (MZ) or urban East Chicago, IN (EC) sites

# Corrosion Performance

## Mobile Exposure on a Truck (in Europe):

*Flat test panels*

	1 year	2 years	3 years
ZM 10um (ZM120)			
GI 10um (Z140, G45)			

28/11/2016

Coatings for Chassis Applications

Truck driven more than 150,000 km/year, (93,000 mi/yr) in various environments (road salts,...)

- On flat bare panels, no red rust on ZM after 3 years vs. GI red rust at the same coating thickness.
- ZM much better than GI

# Corrosion Performance

## GI (Z) & ZM Cut Edge /Hole Corrosion after 5 years exposure - seashore:

- Sample evaluation at Brest (France) - Seashore
- GI (Z): Self healing observed after 1 year, but protection only lasted 1 year
- ZM: Self healing observed after 1 year, and continues to last at least 5 years
- *ZM self healing duration increased by a factor of 4 compared to GI*

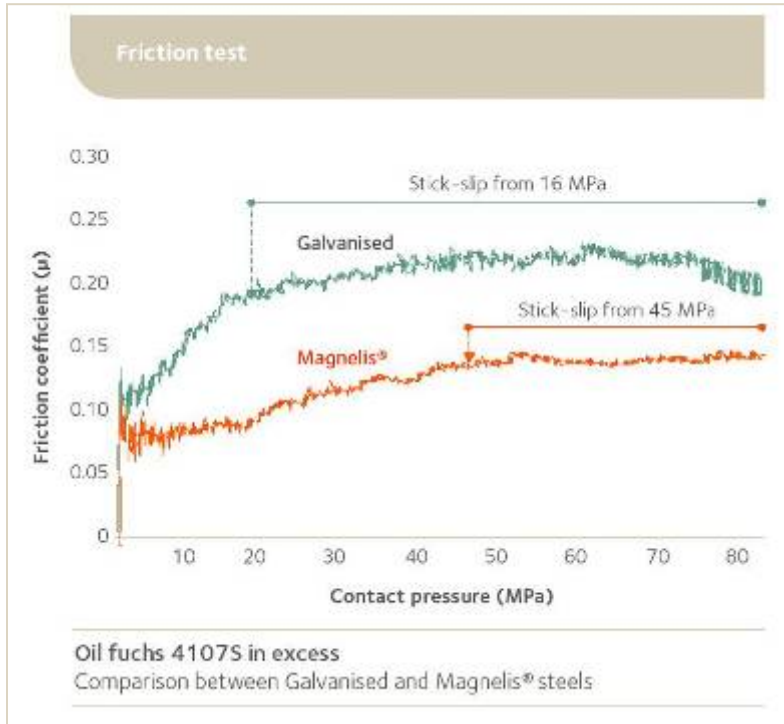

### Pictures after 5 years

# Manufacturing

Formability: *Excellent workability*

Roll Forming

Low friction coefficient and low powdering behavior results in excellent drawing, rolling forming, bending & punching with less tool buildup

# Welding

## Corrosion resistance in Salt Spray test:

1 day	8 days	17 days	29 days	Samples description
24h SST = 1day 31/05/2011	192h SST = 8 days 7/06/2011	408h SST = 17 days 16/06/2011	696h SST = 29days 28/06/2011	
				← ZM with 85% Zn -15% Al weld post coating
				← ZM with Al - Al weld post coating
				← ZM without weld post coating
				← GI without weld post coating
				← GI with Al - Al weld post coating

Samples were salt spray tested until they exhibited 5% Red Rust

- Magnelis® ZM120 (10µ) HFI welded tubes are far more corrosion resistant than GI Z275 [G90] (20µ) HFI welded tubes due to Self Healing effect

# Environmentally Friendly

## Zinc runoff in soils

**The application of Magnelis® ensures the preservation of natural resources since it uses less zinc than pure zinc coatings. Magnelis® reduces considerably the zinc runoff in soils**

# Durability

## Sand abrasion

- Coating hardness has a direct impact on the abrasive wear resistance of the coating

Material	Hardness Index (HV)
Continuous Galvanize	64
Batch Galvanize	70
Galvalume <sup>®</sup> (Aluzinc)	129
Magnelis <sup>®</sup>	141

- Magnelis<sup>®</sup> hardness is much higher (harder) than standard zinc coatings (GI & AZ)
- To date, desert field exposure in Dubai, in collaboration with the French Corrosion Institute, has shown ZM to have 3 times less abrasion/corrosion loss vs. batch galvanize

# Performance Comparison

## HDG (GI) vs. Magnelis® (ZM)

Product Features	HDG GI	ZM
<b>Anti-Corrosion Properties</b>		
In a chloride environment (marine site, roadside)	Reference	+++
In an ammonia environment (barn, farm, greenhouse)	Reference	++
In an SO <sub>2</sub> environment (acid/industrial)	Reference	+
Temporary protection (transport, storage)	Reference	+++
Edge protection (heavy gauge, perforated sheet)	Reference	+++
Corrosion of a deformed part (bent or stamped)	Reference	++
<b>Forming Properties</b>		
Bending & roll forming	Reference	+
Drawing	Reference	+
<b>Assembling Properties</b>		
Spot welding (equivalent thickness)	Reference	=
<b>Aspect</b>		
Visual Appearance	Reference	=

= Equivalent    + Superior    - Inferior

### ZM performance better or equivalent to HDG (GI)

### Designation: A1046/A1046M - 17

Standard Specification for  
Steel Sheet, Zinc-Aluminum-Magnesium Alloy-Coated by the  
Hot-Dip Process<sup>1</sup>

This standard is issued under the fixed designation A1046/A1046M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last approval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or approval.

**1. Scope\***

1.1 This specification covers zinc-aluminum-magnesium alloy-coated steel sheet in coils and cut lengths.

1.2 This product is intended for applications requiring corrosion resistance and paintability.

1.3 The steel sheet is produced in a number of designations, types, grades and classes designed to be compatible with differing application requirements.

1.4 Product furnished under this specification shall conform to the applicable requirements of the latest issue of Specification A924/A924M, unless otherwise provided herein.

1.5 The text of this standard references notes and footnotes which provide explanatory material. These notes and footnotes, excluding those in tables and figures, shall not be considered as requirements of the standard.

1.6 This specification is applicable to orders in either inch-pound units (as A1046) or SI units (as A1046M). Values in inch-pound and SI units are not necessarily equivalent. Within the text, SI units are shown in brackets. Each system shall be used independently of the other.

1.7 Unless the order specifies the "M" designation (SI units), the product shall be furnished to inch-pound units.

1.8 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

**2. Referenced Documents**

2.1 *ASTM Standards:*<sup>2</sup>

<sup>1</sup>This specification is under the jurisdiction of ASTM Committee A05 on Metallic-Coated Iron and Steel Products and is the direct responsibility of Subcommittee A05.11 on Sheet Specifications.  
Current edition approved Feb. 1, 2017; Published February 2017. Originally approved in 2006. Last previous edition approved in 2016 as A1046/A1046M - 16. DOI: 10.1520/A1046\_A1046M-17.

<sup>2</sup>For referenced ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org. For Annual Book of ASTM Standards volume information, refer to the standard's Document Summary page on the ASTM website.

<sup>3</sup>A Summary of Changes section appears at the end of this standard.

# Guardrail Installation

## Approved Countries:

- ✓ *Belgium*
- ✓ *Chile*
- ✓ *Czech Republic*
- ✓ *Norway*
- ✓ *Spain*
- ✓ *Approval for other countries in progress*

## New Installations:

- ✓ *Czech Republic* - Two newly rebuilt sections of the Czech Republic's D1 motorway from Jihlava to Velký Beranov and from Velká Bíteš to Devět křížů, will be equipped with safety barriers using Magnelis® coating. A total of 23 km of one and two-way traffic barriers will be installed between June and November 2017.

# Light Poles – Gent, Belgium

\* Note: Pictures of Magnelis<sup>®</sup> (ZM) light poles in Gent, Belgium

# Conclusions

## Magnelis® (ZM) offers:

- ✓ *Superior corrosion protection (sacrificial & barrier) even in aggressive environments with less coating mass*
- ✓ *Less coating mass required (2 to 3 times less) while achieving equivalent/better corrosion performance than GI*
- ✓ *Edges protection thanks to the self healing effect*
- ✓ *Good weldability (similar to GI)*
- ✓ *Excellent formability and durability*
- ✓ *Environmental friendly coating (less zinc runoff)*
- ✓ *The first C5 (severe environment) certified metallic coating*
- ✓ *An alternative solution to batch galvanized products and other metals*

# Questions?

From steel to safety

*Much more than steel ...*
