

**APPENDIX D**  
**STATION ACCESS DATA**

## Station Access Data

This appendix includes a summary of existing data related to transit access collected as part of the research project, including access mode share characteristics for example stations throughout the United States. Access data include total daily boardings and access mode share for each of the primary access modes: park-and-ride, drop-off, feeder transit, bicycle, and pedestrian. The other primary attributes include:

- Number of auto parking spaces;
- Number of connecting transit lines;
- Population within ½-mile;
- Jobs within ½-mile; and
- Walk Score.

The station access data are organized by station type, which was assigned to each station by the research team.

The data were collected using a variety of sources. Daily ridership and access mode split were obtained directly from the transit agencies operating the service, and were collected between 2006 and 2010. Parking spaces and connecting transit lines were collected by reviewing data available from transit agency websites and third-party sources. Population and jobs information comes from the U.S. Census as reported by the Center for Neighborhood Technology's TOD database, which collates station-area demographic data for all high-capacity transit stations in the U.S. Finally, Walk Score values were collected for each station from the website <http://www.walkscore.com>.
